Initial Medical Care

- Initial medical care is that care routinely provided to every patient, and that is individually listed in nearly every treatment algorithm. While only certain key elements are included in each algorithm, it is understood that every appropriate element of initial medical care is to be included in the care of the patient. Initial medical care shall include:

- **EMT and Paramedic**
  - Ensure scene safety and take appropriate Body Substance Isolation (BSI) precautions
  - Initial assessment
  - Spinal Motion Restriction as patient condition dictates
  - Open and maintain airway. Administer oxygen / provide ventilatory support as appropriate
  - Control obvious bleeding as needed
  - If suspected abuse or neglect, notify law enforcement, Child Protective Services (CPS), or Adult Protective Services (APS), as appropriate.
  - Initiate CPR as indicated
  - Treat fractures and soft tissue injuries
  - Perform cardiac monitoring /12 lead, as appropriate. Provide a copy when transferring care.
  - Obtain history related to the event
  - Vital signs (to include pulse, respirations, BP, pulse oximetry, ETCO2 (if available), and skin temperature
  - Repeated as needed, based upon patient severity.

- **Paramedic Only**
  - Establish and/or maintain a patent airway
    - If nasotracheal intubation is necessary, administer 2-3 sprays of Neo-Synephrine as needed.
  - Establish vascular access. For life threatening situations, **IO is preferred.** Any IV medication may be administered IO.
  - Consider placing a gastric tube when the patient has been ventilated > 2 minutes
12 Lead Indications

Does the patient have one or more complaints from the following list:

- Arm numbness or tingling
- Chest pressure/heaviness
- Unexplained diaphoresis
- Unexplained general weakness
- Syncope
- Shortness of Breath
- Nausea
- Vomiting
- Dizziness
- Not feeling well
- Impending Doom
- Suspected diabetic ketoacidosis
- Suspected drug overdose
- Altered mental status
- Palpitations
- Heart Rate <50 or >150
- Metabolic derangement
  - Examples include: dialysis patients, liver impairment
- New onset of abnormal pain for the patient
  - Examples include: jaw pain, shoulder pain, back pain

<tbody>
<tr>
<td>Consider doing a Pre-hospital 12 lead on this patient.</td>
<td>A Pre-hospital 12 lead needs to be done on this patient.</td>
</tr>
</tbody>
</table>

Risk Factors for Acute Coronary Syndromes include, but are not limited to:

- Family History
- Hypertension
- High Cholesterol
- Diabetes
- Obesity
- High Stress
- Sedentary Lifestyle
- >65 years old or older.
- Male sex (gender)
- Alcohol intake
- Heredity (including Race) —
  - African Americans
  - Mexican Americans
  - American Indians
  - Native Hawaiians
  - Some Asian Americans.
- Tobacco smoke — Exposure to other people's smoke
- Females, diabetic, and elderly patients often present with atypical chest pain or anginal equivalents.

When a 12 Lead is done on a patient, a copy must be provided when transferring care.
Initial Medical Care – Special Circumstances

Special circumstances may occur in any incident in which the resources of the fire department / emergency medical services, such as personnel and equipment, are overwhelmed by the event type, number, and severity of casualties.

- In the event of a special circumstance such as hostile event, or a situation in which resources are overwhelmed, triage and treatment may be altered from the traditional off-lines in order to maximize use of resources and best care for patients. Each agency may have guidelines in place that assist in the management of these situations.

- If the scene is hazardous, due to potential violence, chemicals, or other factors, it is acceptable to delay traditional treatment until patient extraction to a safe area has been completed. Only treatments that can immediately affect life or limb should be performed in an unsafe environment. These treatments may include, but not limited to:
  - Hemorrhage control- application of bandage or tourniquet
  - Tension pneumothorax- chest needle decompression/seal
  - Airway protection- patient positioning or BLS airway
Destination Guideline

For the purpose of providing guidelines to field EMS providers, the EMS Medical Directors recommend that patients be transported to the closest, most appropriate destination based on AEMS categorization criteria. We do not recommend transport to facilities that have not been categorized by AEMS. The EMS Medical Directors feel that patients confirmed or suspected to acutely have the following conditions would be best served by being triaged and transported initially to emergency departments affixed to hospitals with the applicable full medical or trauma intensive care admissions capabilities, as well as facilities with the appropriate interventional cardiovascular, radiologic, and subspecialty capabilities:

- STEMI
- Post-code arrest with Return of Spontaneous Circulation (ROSC)
- CVA/TIA
- Adult L1 and LIII trauma, including burns
- Pediatric trauma (age <15)
- Submersion Incidents/Drownings/Near-Drownings
- Suspected OB/GYN related complications in women known or suspected to be beyond 20 weeks Estimated Gestational Age
- Head, neck, back, thoracic, or pelvic trauma in women known or suspected to be beyond 20 weeks Estimated Gestational Age
- Post-delivery complaints by mother or neonate, up to 30 days post delivery
- Home deliveries, midwife-attended or otherwise
- Those intubated, with supraglottic airways, or on CPAP as acute treatment for respiratory distress
- Brief Resolved Unexplained Event / Apparent Life-Threatening Event (≤ 2 y/o)

The following should be taken to the closest AEMS categorized ED regardless of inpatient, interventional and subspecialty capabilities:

- Code arrest without ROSC (excluding traumatic arrest)
- Lack of functional airway: ET, supraglottic or BLS

In addition, the EMS Medical Directors realize that other factors should be considered when deciding on a best destination. These include, but are not limited to:

- Availability of resources
- Specialty services
- Continuity of care
- Patient choice

Contact on-line Medical Direction, as needed, for assistance with determining destination.
Courtesy Notification

• On-line treatment orders may only be received from on-line medical direction. If an on-line physician outside the Base Station wishes to give treatment orders, the ALS provider must contact his or her assigned on-line medical direction; the exception to this is in the case of a burn patient or a trauma patient. On-line treatment orders may be received from a burn center physician or a trauma physician.

• Clearly state at the beginning of an on-line communication if you are making a “courtesy notification” or if you need to “obtain On-line Medical Direction.” If you are seeking orders, you are making a decision to “obtain On-line Medical Direction.”

• An ALS Courtesy Notification (CN) should be brief and include the following patient-related information:
  – Case (incident) number and/or patient name if requested
  – Age
  – Chief complaint
  – ETA
  – Special equipment in use or needed. Examples include: CPAP, ventilator, bariatric equipment, translator or restraints.
  – Treatments rendered
  – Vital signs, if abnormal (complete set)
  – Mechanism of injury (trauma)

• Notification is optional on BLS transports. Notification may be done by phone or electronically.

• If a facility refuses to accept a patient during phone notification, contact on-line medical direction.
On Scene Physician

- A paramedic may follow the orders of an on-scene physician after obtaining On-line Medical Direction to medical control and obtaining a release from on-line medical control. The on-scene physician must be licensed to practice medicine in the state of Arizona and agree to accompany the patient to the receiving hospital in the ambulance. The paramedic may not follow any requests that are outside the scope of practice of a paramedic in the state of Arizona.

- The paramedic may wish to have the on-scene physician communicate directly with medical control to optimize patient care.

- The paramedic should clearly document the name and license number of the physician along with obtaining their signature on the patient care record.
Determination of Death Guideline

- Prehospital providers respond to patients of cardiopulmonary arrest in a variety of circumstances. The following guideline is intended to assist in determining how and when resuscitative measures should be withheld, initiated, and/or terminated. Refer to appropriate SOP’s and related treatment algorithms for other specific information.

**Obvious Death**

- If the patient meets the criteria listed below, no resuscitative efforts need to be initiated. Online medical direction is NOT necessary. Contact PD and initiate grief support. An EMS provider must remain with the patient until released to PD.

- All of the following criteria must be met:
  - Patient is pulseless and apneic
  - Asystole is confirmed on the monitor in two leads for at least ten seconds
  - Presence of one or more signs of irreversible death
  - Time down is presumed to be greater than 30 minutes
  - Hypothermia is not present
  - No on-scene request for resuscitative measures

**Signs of Irreversible Death**

- Decapitation*
- Decomposition*
- Dependent lividity
- Rigor mortis
- Pulseless and apneic with extrusion of brain matter
- Pulseless and apneic with removal of the lower half of the body
- Pulseless and apneic with full thickness burns over 90% of total body surface area

*Documentation of asystole by monitor is not needed.

Please refer to the Field Termination Guidelines as needed.
Determination of Death Guideline

Prehospital Medical Care Directive (PMCD)

- Adults and children, usually with terminal illnesses, may not wish to have any resuscitative measures attempted if they become pulseless and apneic. Every attempt should be made to honor these “do not resuscitate” (DNR) requests. If the patient is not in cardiopulmonary arrest on arrival of EMS providers, refer to the appropriate treatment algorithm and begin treatment.

- To honor DNR requests:
  - Patient must be pulseless and apneic with no vital signs or signs of life
  - An orange PMCD is readily available. Up to two minutes can be taken to locate the document.
  - The document appears to be valid
  - If valid DNR is present, family resuscitative requests do not need to be honored. (A.R.S.36-3205)
  - On-line medical direction is NOT required
Field Termination Guidelines
- Medical Patients

The purpose of this document is to assist decision-making regarding termination of resuscitation efforts for medical patients. Individual patient situations vary. Therefore, this guideline is not meant to be all-inclusive and does not take the place of using sound judgment. The paramedic retains the right to resuscitate any patient and/or seek on-line medical direction when it is deemed in the best interest of all concerned. This document does not apply to patients who meet the obvious death criteria or who have a properly completed Prehospital Medical Care Directive. Please refer to The Determination of Death guidelines as appropriate.

All tubes (e.g., IVs, ET tubes) used during a resuscitation effort must be left in place unless the patient’s primary care physician acknowledges he/she will sign the patient’s death certificate.

1. Initiate resuscitation unless valid DNR is available.

2. Perform 4 rounds of CCR/MICR or ACLS. Focus on on-scene resuscitation versus “load and go”.

3. Consider Termination of Resuscitation if the following criteria are met:
   • Not Witnessed
   • No shockable rhythm (i.e., Asystole)
   • No ROSC (return of spontaneous circulation)

4. If patient meets all 3 criteria after 4 rounds of CCR/MICR or ACLS, consider termination of resuscitation (TOR). Termination of resuscitation requires on-line medical direction. If ROSC is achieved, continue treatment and refer to Post-Arrest Stabilization Off-line.
Field Termination Guidelines
- Trauma Patients

General Principles:

1. Attempt resuscitation of all patients found pulseless and apneic, unless any of the following are present:
   – Prehospital DNR present with the patient
   – Dependent lividity or rigor mortis
   – Decomposition
   – Decapitation
   – Evidence of massive blunt head, chest, or abdominal trauma
   – Third degree burns over more than 90% of the total body surface area

1. Blunt Trauma Arrest:
   – Contact Base for TOR if patient found apneic, pulseless, and without organized cardiac activity or
   – Contact Base for TOR if patient found apneic and pulseless and no response to BLS care including chest compressions and bag valve mask ventilations. (Do we need a time frame, 10 minutes?)

2. Penetrating Trauma Arrest:
   – Resuscitate and transport to a trauma facility.
     • If time of arrest suspected to be > 10 minutes, and no signs of life or response to BLS care (as above), consider base contact for TOR.

3. When the mechanism does not correlate with the clinical condition, suggesting a nontraumatic cause of cardiac arrest, standard resuscitative measures should be followed

4. After pronouncement, do not alter condition in any way or remove equipment (lines, tubes, etc), as the patient is now a potential Medical Examiner case.
Management of Pediatric Cardiac Arrest

**Traumatic Cardiac Arrest**
- Pediatric traumatic cardiac arrest patients who do not meet the criteria for field termination of resuscitative efforts should be transported by the most expedient means to an appropriate Trauma Center, preferably with pediatric capabilities. If the patient is considered non-salvageable, On-line Medical Direction should be contacted for the consideration of field termination or for an alternative destination.

**Non-traumatic (Medical) Cardiac Arrest**
- **In the absence of a specific protocol recommending a destination.**
  If an airway and IV/IO access is obtained and there is return of spontaneous circulation during the resuscitative effort pediatric patients should be transported to an appropriate hospital with pediatric critical care capability. Transport should be performed by the most expedient means.
  
  - If an airway and IV/IO access cannot be established, the patient should be transported to the closest local hospital emergency department by the most expedient means.
  
  - If there is no return of spontaneous circulation during the resuscitative effort, the patient should be transported to the closest local hospital emergency department by the most expedient means.

**Notes**
- Airway stabilization may be either an advanced airway or BVM ventilation with good air movement and appropriate monitoring.
  
  - Air medical services may transport directly to a facility with pediatric critical care services if transport time is not significantly prolonged.
Refusal of Treatment and/or Transport

**Purpose**
- To define the circumstances and situations where paramedics may accept a patient’s refusal of treatment and/or transport

**General Guidelines**
- All patients who request transport to the hospital will be transported.
- Any patient who complains of any pain, discomfort, or problem will have an assessment performed:
  - If the patient refuses an assessment, document the manner of the refusal and the patient’s reason for the refusal in the report.
  - Assessment should include all items referenced in the treatment algorithm related to the patient’s complaint.
- In all cases, a refusal form will be filled out and signed by the patient or appropriate consenting adult (if the patient is a minor).
  - If the patient refuses to sign the form, document the reason and have a witness sign the form.
- Offering opportunity for 3rd party to assist patient with decision-making and whether patient permitted or declined such assistance (if applicable).
- Decision making capacity must be demonstrated and documented as defined by these abilities:
  - Receive and comprehend information needed to make a decision
  - Process and deliberate a decision and its potential consequences
  - Make and articulate a decision that is consistent over time
  - Justify that decision with logic that fits the persons own value system.

**Who Can Refuse**
- The patient must meet all of the following criteria:
  - Is an adult (18 or over), or if under 18, is being released to a parent, guardian, responsible party, or law enforcement personnel
  - Is oriented to person, place, time, and event.
  - Exhibits no evidence of:
    - Altered level of consciousness
    - Alcohol or drug use that impairs judgment
  - Understands the nature of his/her medical condition, as well as the risks, and consequences of refusing care. (Decision making capacity.)
- An adult accepting care for a minor must sign the refusal form.
- Normal range vitals: See ALS Release of Patients for BLS Transportation algorithm. If abnormal vital signs, obtain On-line Medical Direction for refusal.
Refusal of Treatment and/or Transport

Who Cannot Refuse Without An On-line Physician Order (High Risk Refusals)

On-line medical direction is required in the following situations in which a patient is refusing treatment and/or transport (high-risk refusals). On-line physician contact must be made before leaving the scene. When contacting on-line medical direction, please use verbiage to recommend whether a transport is appropriate.

- Any patient that is a danger to self or others.
- Any patient that have been stunned/stopped by means of an electro-muscular disruption weapon (i.e., TASER). Include ECG monitor strip with documentation.
- Any pediatric patient with reported symptoms by history or exam, including apnea, choking, color change, marked change in muscle tone (limpness), abnormal behavior, or increased work of breathing.
- Any patient to which medication has been administered, including oxygen.
- Any patient that lacks decision making capacity. Examples: language barrier, diminished mental capacity.
- Minors that wish to be released to anyone other than parent or guardian.
- Abnormal range vitals: See ALS Release of Patients for BLS Transportation algorithm.
- Any patient with any of the mechanisms or conditions that should be transported to a Trauma Center in the Arizona Trauma Patient Identification & Field Triage Decision Standard.
- Any patient that has any of the following characteristics or complaints:
  - Abdominal pain
  - Change in mental status
  - Acute cardiac dysrhythmia
  - Chest pain, suspected cardiac etiology or anginal equivalent
  - Electrical injury
  - Foreign body ingestion
  - Head injury
    - LOC, on blood thinning medication including aspirin; age less than 2 or greater than 60; vomiting; or cognitive impairment
  - Inability to walk (not normal for patient)
  - Overdose or poisoning
  - Pregnancy-related complaint
  - Seizures
  - Syncope or near syncope
  - Submersion incident

Updated Dec 3, 2012
Refusal of Treatment and/or Transport

**Documentation**
Reports shall include:
- Patient name, age
- Date of birth (DOB)
- Medical history
- Two complete sets of vital signs
- Chief complaint
- Mental status exam findings (speech, gait, appropriate behavior, cooperative, follows instructions/commands)
- Physical exam findings
- Reason for refusal
- Signed refusal form
- Advice given
- Patient understands risks of refusal
- Patient understands possible outcome if advice is not followed
- Decision making capacity
- Third party involvement

**Refusal Form Signatures**
- Witnessed by law enforcement officer, family member, or friend
- If a minor is refusing, adult accepting care for child must sign
- If patient/adult refuses to sign, get witnessed by police if possible
Paramedic Ride in Guidelines

PURPOSE
The purpose of this document is to provide guidance in recognizing patient care situations that may require ride in with an additional ALS provider. This document is not intended to replace any agency specific policies or recommendations. Each agency should have an ALS-ALS transfer of care protocol which must be available to the transport agency.

GUIDELINES
It is recommended that an additional ALS provider consider riding in to assist in the care of the patient if there is an increased likelihood of complications or deterioration. Some criteria that should be considered include:

- Abnormal vital signs
- Altered mental status
- Abnormal neurologic exam
- Current, or risk of, unstable cardiac dysrhythmia
- Use of medication to support blood pressure
- Respiratory compromise or impending failure
- Uncontrolled or difficult to control bleeding

It is recommended that an additional ALS provider ride in to assist in the care of the patient in the following situations. These are some examples of situations with an increased likelihood of problems developing en route.

- Acute Stroke
- Acute MI
- Cardiac arrest / Return of Circulation
- Eclampsia / preeclampsia
- Imminent delivery
- Agitated, combative, or restrained patient
- Seizures
  - Adult – active seizure or status epilepticus
  - Pediatric - first-time seizure, active seizure, persistent febrile seizure, or status epilepticus
- Trauma - all immediate (by injury) patients
- Vaginal bleeding in pregnant patient with fetus of viable age (20 weeks)

In addition a second ALS provider should accompany the patient any time that it is requested by one of the treating paramedics.

If an ALS provider chooses not to ride in with the patient in any of the above situations, the member’s rationale for that decision must be supported by his or her documentation.
Criteria 1: Non-emergency category must have vital signs within the following limits:

- **Adult**
  - Temp* < 101
  - Respirations 10 to 24
  - BP 90 to 160 systolic
  - Pulse 60 to 100
- **Child**
  - Temp* < 101
  - Res respirations 20 to 30
  - BP 70 mm Hg + (2 times age in years)**
  - Pulse 60 to 150

  * If fever suspected
  ** For age specific Pediatric BP, please refer to Page 48

Criteria 2: The following high-risk indications must be absent:

- Abdominal pain
- Altered mental status (altered for patient)
- Any acute cardiac arrhythmia
- Chest pain
- Electrocuton
- Foreign body ingestion
- Inability to walk (not normal for patient)
- Overdose or poisoning
- Patient volunteers high-risk condition
- Pregnancy-related complaint
- Seizures
- Syncope or near syncope
- TASER
- Water-related incidents

Criteria 3: Absence of significant findings on physical exam

A physical exam must be completed and documented. After evaluation, the patient must have no signs, symptoms, or history that would indicate (or appear to indicate) significant findings or an emergent condition.

Yes

Release patient to BLS transport unit

No

Obtain Online Medical Direction to medical control to gain approval for BLS transport OR transport ALS
Abdominal Pain
– Non-Traumatic, Non-Pregnant
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access

Is the systolic BP < 90?

Yes

Administer 250 mL boluses of NS as long as lungs remain clear and systolic BP < 90

No

Courtesy notification to receiving facility

Refer to Pain Management Off-line as needed.
Nausea / Vomiting
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access

Administer **Ondansetron**
4-8mg IV or IM.
If given IV, slow over 2-5 minutes.

May give **Ondansetron Oral Dissolving Tablet**
4-8 mg PO

PO dose may be given by breaking ODT tablet or giving IV solution PO

Courtesy notification to receiving facility
Obstetrics
Adult (≥ 15 y/o)

Pregnancy (>20 weeks) with labor pains, abdominal pain, or “High Risk**”. See notes below.

Initial medical care

Establish vascular access

Place the patient in a left lateral recumbent position.

Yes

If pre-eclamptic or seizing-Give Magnesium Sulfate 4-6 grams IV over 10-15 minutes. (Add 4 G to 100 mL D5W, LR, or NS. Resulting concentration is 40 mg/mL).

Transport the patient to the nearest Level III perinatal facility.

obtain On-line Medical Direction for further orders. Courtesy Notification is okay if transporting to a facility with a Neonatal ICU.

No

Determine whether the patient is “High Risk”?

Contact medical control

Note:

High risk pregnancies include: prematurity (<32 weeks), any bleeding in third trimester, pre-eclampsia/eclampsia (seizures), no prenatal care, twins or >, premature rupture of membranes, antepartum hemorrhage (abruptio placenta, placenta previa, and uterine rupture), or other complications of labor (breech position, prolapsed cord, ect.), or recent drug use. These patients need transport to Level III perinatal facility.

Eclamptic Syndrome can occur up to 6 weeks post delivery.

All OB patients should be transported to the ED if the L&D department does not have a ground floor direct entrance. The patient should be rapidly assessed in the ED. If the patient needs to go to L&D without further delay, a hospital provider will accompany the patient and EMS crew to L&D, according to hospital policy.
### Initial medical care

Establish vascular access
Do not delay treatment while establishing vascular access

#### Anaphylaxis

- Systolic < 90 and/or
- Severe facial angioedema and/or
- Severe respiratory distress

#### Epinephrine

- IM: 0.3-0.5 mg (1:1,000 solution)
- IV/IO: If no response or patient in extremis, 0.1 mg (1:10,000) every 5 minutes or until IV infusion 2-10 mcg/min is established.

#### Diphenhydramine (Benadryl)

- IV/IM: 50 mg

#### Methylprednisolone (Solu-Medrol)

- IV/IM: 125 mg

#### Consider Albuterol (Proventil)

- SVN: 2.5 mg in 3.0 mL NS for respiratory distress; repeat as needed

#### Acute Allergic Reaction

- Diphenhydramine (Benadryl)
  - IV/IM: 50 mg

- Methylprednisolone (Solu-Medrol)
  - IV/IM: 125 mg

- Consider Albuterol (Proventil)
  - SVN: 2.5 mg in 3.0 mL NS for respiratory distress; repeat as needed

#### Courtesy notification to receiving facility

### Mild Distress
- Itching, isolated urticaria, nausea, no respiratory distress

### Severe Distress
- Stridor, bronchospasm, severe abdominal pain, sudden unexplained cardiovascular collapse in a previously normal patient, respiratory distress, tachycardia, shock, generalized urticaria, edema of lips, tongue or face (angioedema)
Respiratory Distress
Adult (≥ 15 y/o)

Initial medical care

Establish vascular access.
Do not delay treatment while establishing vascular access.

Allergic Reaction

Normal Lung Sounds

Wheezes Bronchospasm

Rales/Pulmonary Edema/CHF

Proceed with appropriate algorithm

Respiratory distress

Albuterol (Proventil) 2.5 mg in 3.0 mL NS by SVN or in-line BVM. Repeat as needed, based on assessment.

Ipratropium bromide (Atrovent) 500 mcg may be added to Albuterol SVN to a max of 3 times.

Methylprednisolone (Solu-Medrol) 125 mg IV/IM

If patient alert and systolic > 90:
Nitroglycerin 0.4 mg tablets or spray every 5 min X 3 as long as BP remains > 90

If unable to establish vascular access, obtain On-line Medical Direction

Patients complaining of dyspnea should be suspected of having pneumonia when they present with fever, productive cough, possible pleuritic chest pain, history of being bedridden, known immunocompromise, diabetes, elderly and lung sounds indicative of consolidation. Refer to Sepsis off-line, as needed.

If wheezes change to stridor, LOC decreases, condition worsens, or patient is on Albuterol at home
CONSIDER:
Epinephrine IM: 0.3-0.5 mg (1:1,000 solution), if age < 35, systolic BP < 180, and no cardiac history or pregnant.

Magnesium Sulfate 2 gms in 50cc NS 60gtts over 5 minutes for severe asthma.

Courtesy notification to receiving facility
Altered Mental Status
(Non-trauma)
Adult (≥ 15 y/o)

This protocol is used for patients with altered mental status where the etiology is unknown. Consider history and possibility of dysrhythmias, medication side effects, electrolyte imbalance, inner ear disorders, CVA, TIA, drug overdose, diabetic emergency, and MI. An ECG and glucose check are required on all patients with altered mental status.

Initial medical care

Establish vascular access

For suspected opioid overdose with associated respiratory depression.

Naloxone
IV, IO, IM, or ET: 0.4mg - 2.0 mg; may repeat every 2 minutes as needed.
Intranasal: 2 mg into each nostril; may repeat every 2 minutes as needed.

OR
Nalmefene
0.25 to 0.5 mg IV, IM, or SC based on respirations; if no response, may give 0.5 to 1.0 mg in 2 to 5 minutes

Check blood glucose. Is level < 60 mg/dL?

Yes

Refer to Hypoglycemia
Off-line

No

Courtesy notification to receiving facility

- Refusal requires On-line Medical Direction (high-risk). All patients with a syncopal episode or near-syncope should be transported to the hospital via ambulance. Provide respiratory support as indicated.
- Arizona Opioid Assistance and Referral Line: 1-888-688-4222 Free and confidential. Translation services available.
Hypoglycemia
Adult (Patients ≥ 15 y/o)

Initial medical care, consider 12 lead, while initiating treatment for hypoglycemia

Establish vascular access

Check blood glucose. Is level < 60 mg/dL?

Yes

If the patient is awake and has a patent airway, 1-2 tubes of oral glucose may be given.

Dextrose 12.5 – 25 gm IV (D10 125-250mL)
(Administer glucagon 1-2 mg IM if no IV)

Recheck blood glucose.

No

Refer to appropriate off-line

On line medical direction is required for high risk refusal.

High risk patients for recurrent hypoglycemia:
Use of long-acting insulin agents (Lantus, Leveimir, NPH)
Complicating factors (seizure, concern for intentional overdose, fever, other medical complaints)
Use of oral diabetic medications, specifically sulfonylureas (glipizide, glyburide, glucotrol, diabeta, glimepiride, amaryl, diabinese, tolinase, micronase, orinase, tol-tab, glycron, duactact, glynasel prestab, glucovance, avandaryl, chlorptopamide, metaglip, tolbutamide, tolazamide etc.)

If patient is refusing transport, remain on-scene to ensure that patient eats. Do not release patient unless blood sugar > 80.
Seizures
Adult (≥ 15 y/o)

Initial medical care

Consider causes*
If blood glucose level < 60 mg/dL, refer to altered neurological off-line.

- For ongoing seizure or seizure lasting > 5 minutes, more than two seizures in one hour, or status epilepticus
- If age > 60, consider reducing dose by half
- If seizure persists, may repeat IM dose once in 10-15 minutes
- For IN dose, use a MAD, Midazolam 5 mg/mL concentration, & split dose between nostrils

Midazolam 0.2 mg/kg IM/IN
If < 40 kg, max dose = 5 mg IM/IN
If > 40 kg, max dose = 10 mg IM/IN

Lorazepam, Midazolam, or Diazepam, IV 0.1 mg/kg IV
Administer slowly over 2 minutes
Max single dose 4 mg
Max of two doses, regardless of route.

Document history:
- Type of seizure?
- Witnessed by crew?
- First seizure?
- History of seizures?
- Fever?
- Length of seizure?
- Usual mental status?

Notes:
1. Females in their third trimester of pregnancy that are seizing should be assumed to have eclampsia. If the patient is an eclamptic female, place patient in left lateral recumbent position, minimize external stimuli, and administer Magnesium Sulfate 4-6 G IV bolus over 10-15 min (Add 4 G to 100 mL D5W, LR, or NS. Resulting concentration is 40 mg/mL).
2. IV Benzodiazepine administration has been associated with respiratory depression and respiratory arrest. For IM administration, inject deep into large muscle mass. Valium should only be used if Ativan and Versed are unavailable.
**Stroke**  
**Adult (≥ 15 y/o)**  

**Initial medical care**  
- Place patient on O2, as appropriate.  
- Obtain blood glucose  

Establish vascular access and obtain FAST score  
- Facial droop (1); Arm Drift (1); Speech (1); Time (time of symptom onset less than 24 hours)  
  (or longer time period as specified by Primary Stroke Center)  

**Positive FAST Score of 2**  
- Yes: Call “Stroke Alert” in report to receiving facility and transfer to closest appropriate facility  
- No: CN and transfer to closest appropriate facility  

---

**Plan:** During patient assessment, EMS providers will give pre-notification of acute stroke patients that may be candidates for acute intervention. When the paramedic identifies such a patient, he/she will provide telemetry notification that they are in transit with a “Stroke Alert” patient and give an estimated time of arrival.

EMS providers will document the patient’s FAST Score (Face asymmetry, Arm drift, Speech deficit, Time onset) along with standard Vital Signs, Blood Sugar and if another center was bypassed to go to a primary stroke center.

**Action:** At the beginning of the courtesy notification, the paramedic will clearly state that they have a “Stroke Alert” patient. The base hospital will advise what facility to transport the patient to. This same term will be used to notify the in-hospital stroke team and ancillary services.

**Candidates for Stroke Alert:** Any patient with acute onset of focal neurological deficit(s) such as facial asymmetry, arm drift, or slurred speech, known to have had an onset within 24 hours.

**Non-candidates for Stroke Alert:** Patients with complaint exclusively of generalized weakness, dizziness, syncope, loss of consciousness/coma, a fall, seizure, headache, head trauma/injury.

**Additional Treatment:** Do not treat hypertension in patients suspected of having acute stroke unless directed to do so via online medical direction.

**For Pediatric Patients (≤ 14 years old) exhibiting signs/symptoms of a Stroke, contact medical direction for destinations orders.**
Adrenal Insufficiency
Adult (≥ 15 y/o)

Includes patients with a known medical history of adrenal insufficiency, such as Congenital adrenal hyperplasia (CAH), Panhypopituitarism, Long-term use of steroids (replacement therapy, asthma, COPD, rheumatoid arthritis, and transplant recipients), who are presenting with Illness or injury, including but not limited to:

- Shock/hypoperfusion
- Fever > 100.4°F
- Multi-system trauma
- Multiple long bone fractures
- Hyperthermia or hypothermia
- Respiratory distress
- Partial or full thickness burns > 5% BSA
- Drowning
- Vomiting/Diarrhea with signs/symptoms of dehydration

**Initial medical care**

- Administer supplemental oxygen, titrate oxygen to SaO₂ ≥ 94%
- If pregnant, place in left lateral recumbent position
- If hypotensive or no palpable pulse, administer boluses 10-20 cc/kg of NS or LR as long as lungs remain clear and systolic BP < 90. Use caution if patient has a end stage renal disease or CHF (refer to Shock/Hypotension guideline)
- Correct blood glucose if < 60 mg/dl (refer to Hypoglycemia guideline)

**Establish vascular access**

- Cardiac monitor
- Stress dose steroids:
  - Assist patient with home medication: hydrocortisone (Solu-Cortef). Adult: 100 mg IM
  - Stress dose steroids (if home medication not available):
    - Methylprednisolone 2 mg/kg IV (max 125mg)

**Courtesy notification to closest appropriate facility**

Pediatric (≤14 y/o)

- Cardiac monitor
- Stress dose steroids:
Poisoning/Overdose

Initial medical care (including ECG monitoring)

Establish vascular access

Inspect the scene.
Collect containers for transport to receiving facility.
Contact Poison Control (602-253-3334) for advice, if needed.
Treatment orders must be obtained from on-line medical direction.

If patient has a suspected tricyclic antidepressant (TCA) overdose, consider Sodium Bicarbonate. If the patient is symptomatic and/or has abnormal ECG changes, obtain On-line Medical Direction and request orders for Sodium Bicarbonate:
50-100 mEq IV.

 Courtesy notification to receiving facility

Document:
- Type of ingestion (What, when, how much.) Bring the substance ingested including packaging/pills to receiving center.
- Past history (medications, suicide attempts)
- Action taken by bystanders (induced emesis? “Antidote” given?)
Acute Dystonic Reaction
Adult (≥ 15 y/o)

Dystonia is a neurological movement disorder characterized by involuntary muscle contractions, which force certain parts of the body into abnormal, sometimes painful, movements or postures. Dystonia can affect any part of the body including the arms and legs, trunk, neck, eyelids, face, or vocal cords.

Signs and symptoms of a dystonic reaction may include protruding or pulling sensation of the tongue; twisted neck, or facial muscle spasm; roving or deviated gaze; abdominal rigidity and pain; and/or spasm of the entire body.

The following medications can cause dystonia (partial list):
- Acetophenazine (Tindal®)
- Amoxapine (Asendin®)
- Chlorpromazine (Thorazine®)
- Fluphenazine (Permitil®, Prolixin®)
- Haloperidol (Haldol®)
- Loxapine (Loxitane®, Daxolin®)
- Mesoridazine (Serentil®)
- Metaclopramide (Reglan®)
- Molindone (Lindone®, Moban®)
- Perphenazine (Trilafon® or Triavil®)
- Piperacetazine (Quide®)
- Prochlorperazine (Compazine®, Combid®)
- Promazine (Sparine®)
- Promethazine (Phenergan®)
- Thiethylperazine (Torecan®)
- Thioridazine (Mellaril®)
- Thiothixene (Navane®)
- Trifluoperazine (Stelazine®)
- Triflupromazine (Vesprin®)
- Trimeprazine (Temaril®)
Shock/Hypotension
Adult (≥ 15 y/o)

Initial medical care

Establish vascular access. Administer boluses 10-20 cc/kg of NS or LR as long as lungs remain clear and systolic BP < 90. Use caution if patient has a end stage renal disease or CHF.

If pulse is >160 bpm, refer to appropriate off-line.
If pulse is <60 bpm, refer to appropriate off-line.
Check blood glucose - if < 60 mg/dL, refer to appropriate algorithm

Consider **Dopamine**
IV infusion: 2 to 10 mcg/kg/min

Courtesy notification to closest appropriate facility

All patients with a syncopal episode or near-syncope should be transported to the hospital via ambulance. Refusal requires on-line medical direction (high-risk).
Sepsis Alert

The purpose of a sepsis alert is to provide pre-arrival Emergency Department notification in order to facilitate rapid assessment and ongoing treatment of a patient with suspected severe sepsis. These cases must be recognized early and treated aggressively to prevent progression to shock and death.

A sepsis alert will be activated en route to the receiving facility for either of the above scenarios. A hospital’s specific response to sepsis alerts will vary depending on resources and internal protocols.

Your patient meets SEPSIS CRITERIA if conditions 1 + 2 are present

Your patient meets SEVERE SEPSIS CRITERIA if conditions 1 + 2 + 3 are present

Markers of Systemic Inflammatory Response Syndrome (2 or more criteria = SIRS)

- Temp ≥ 100 or ≤ 97
- HR ≥ 90
- RR ≥ 20
- Glucose > 140 in non-diabetic
- Altered mental status

Suspected Infection or Immunosuppression

- Open wounds, sores, cellulitis
- UTI
- Pneumonia
- Meningitis
- Indwelling medical device
- Vomiting, diarrhea
- Recent surgery/procedure
- Chemotherapy < 6 weeks
- Chronic steroid use

Markers of Systemic Inflammatory Response Syndrome (2 or more criteria = SIRS)

- Temp ≥ 100 or ≤ 97
- HR ≥ 90
- RR ≥ 20
- Glucose > 140 in non-diabetic
- Altered mental status

Obtain focused history and perform assessment

A sepsis alert will be activated en route to the receiving facility for either of the above scenarios. A hospital’s specific response to sepsis alerts will vary depending on resources and internal protocols.

Your patient meets SEPSIS CRITERIA if conditions 1 + 2 are present

Your patient meets SEVERE SEPSIS CRITERIA if conditions 1 + 2 + 3 are present

Suggestion of Shock

- SBP < 90 or MAP < 65 or SBP drop of 40 mmHg from prior baseline
- ETCO2 ≤ 25
- O2 sat ≤ 92% on RA
- Mottled or cold extremities
- Central cap refill ≥ 3 seconds
- Purpuric rash
- No radial pulse

Treatments

- Supplemental oxygen to maintain saturations ≥ 92%
- 2 large bore IVs preferred
- Administer boluses of 10-20 cc/kg NS as long as lungs remain clear
  - Use caution if patient has end-stage renal disease or CHF

Notify closest appropriate facility of SEPSIS ALERT, if applicable
**Pain Management**

**Adult (≥ 15 y/o)**

1. **Initial medical care**
   - Constant monitoring of ABCs and vital signs (including pulse oximetry) is required.
2. **Morphine for analgesia**
   - **IV:** 2-5 mg increments IV until pain relieved up to 20 mg.
3. **Fentanyl**
   - **IV:** 1 mcg/kg given in incremental doses of 25-50 mcg, may repeat every 5 minutes, as needed to max of 200 mcg total.
   - **Intranasal:** 1-2 mcg/kg given in incremental doses 25-50mcg to a max of 200 mcg.

- **Assess pain and document pain score before and after repeat medication administration.**
- **Courtesy notification to receiving facility**

Before administering meds for pain, ask the patient to quantify their pain on a 1 to 10 scale. Document this information and use it as a guide to measure the effectiveness of analgesia.

Age > 60: Reduce dose by half

**IV route offers better means for titration of med. Absorption via IM route may be unpredictable and should be used as a last resort – use only if no vascular access. Documentation must reflect rationale for IM route, if used.**
Sedation
Adult (≥ 15 y/o)

Sedation should only be administered when indicated in specific off-line.

### Sedation

**Lorazepam (Ativan)**

- **IV/IM:** 2-4 mg. May repeat once in 10-15 minutes, if needed

**Or Midazolam (Versed)**

- **Age 15 to 60:**
  - **IV:** 1-5 mg titrated to effect; administer slowly in increments of no more than 2.5 mg over at least 2 min; total dose no more than 20 mg
  - **IM:** 2-10 mg. Max of 10mg every 10 minutes up to total dose of 20 mg
  - **Intranasal:** 0.2-0.3 mg/kg to a max of 10mg. May repeat once if needed. Must use 5mg/ml concentration

**Or Diazepam (Valium)**

- **IV:** 5 -10 mg in 2 mg increments no faster than 2 mg/min

**Or Ketamine**

Use of Ketamine is an optional sedation medication for extreme cases of agitation / excited delirium and requires special training and agency approval.

**Ketamine**

- **IV:** 1 mg/kg. Max single dose of 150 mg. May re-medicate every 5 minutes.
- **IM:** 2 mg/kg. Max single dose of 250 mg. May re-medicate every 10 minutes.

### Special Considerations

- Age > 60: Reduce dose by half
- If other CNS depressants, including alcohol and benzodiazepines, are on board, decrease dose
- Sedation has been associated with respiratory depression and respiratory arrest. Monitor patient closely with cardiac monitor, SPO2 and ETCO2, if available

Updated August 9, 2017
Agitated/Combative/Excited Delirium Patient
Adult (≥ 15 y/o)

If a patient is violent and an immediate threat to the patient, EMS crew, or bystander safety exists, physical restraint may be used to prevent the patient from harming him or herself or others. If the patient is not violent, be alert for possible violence and avoid provoking the patient.

Note: Sedation medications have been associated with respiratory depression and respiratory arrest. Monitor patient closely.

Patient Assessment
1. An ALS provider must assess a patient that is restrained.
2. The patient must be under direct supervision at all times during treatment and transport.
3. The patient’s airway, breathing, and vital signs – including pulse oximetry – should be monitored closely at all times.
4. Circulation to the extremities shall be evaluated at least every 10 minutes when restraints are applied.

Type of Restraint - 1) Handcuffs may only be used as restraint devices when a law enforcement officer accompanies the patient to the hospital. A patient that is in police custody will require a handcuff key inside the ambulance during transport. The paramedic should have immediate access to keys needed to release handcuffs or other restraining devices. 2) Only non-locking leather or other ALS provider approved “soft” restraints may be applied and used by medical providers.

Patient Positioning – 1) Patients shall be positioned in a manner that does not compromise airway or breathing. 2) Restraints shall be placed in such a manner as to not preclude evaluation of the patient’s medical status or injure the patient in any way.

Documentation - If restraints are necessary, documentation must include:
- Reason restraint was required
- Type of restraint used
- Position of the patient during treatment and transport
- Status of circulation distal to restraints
- Patient status at the time of transfer of care
- Data indicating constant supervision of ABCs and vital signs, including pulse oximetry
- Total time the patient was restrained while in the care of ALS provider

Initial medical care

Is the patient an immediate threat to him/herself, the EMS crew, or bystanders?

Constant monitoring of ABCs and vital signs (including pulse oximetry) is required. Apply physical restraints as necessary. If restraints are used, the ALS provider is to accompany patient to receiving facility.

Establish vascular access. Check blood sugar. If < 60 mg/dL, refer to altered neuro off-line.

Refer to Sedation Off-line, as needed for chemical restraint

Cool patient, as needed

Courtesy notification to receiving facility
TASER Patients

Initial medical care
Evaluation of ABCs and vital signs (including cardiac monitoring) is required.

Is the patient an immediate threat to him/herself, the EMS crew, or bystanders?

No

Yes

Apply physical restraints as necessary. If restraints used, the Valley Fire Agency ALS member is to accompany patient to receiving facility. Refer to the Violent/Combative Patient and/or Sedation Off-lines as needed.

Persons that have been stunned/stopped by means of an electro-muscular disruption weapon (i.e., TASER) must be evaluated by ALS and an obtain On-line Medical Direction must occur for refusal. An ECG monitor strip must be evaluated and attached to the chart for any patient situation involving the use of a TASER. Obtain 12 Lead ECG, if able.

1. The TASER probes may be removed by EMS providers, unless they are in a high risk area. If the TASER probe is in a high risk area (face, neck, hand, bone, groin, or spinal column), where it may injure bone, nerves, blood vessels, or an eye, do not remove the probe. Transport the patient to the ED in an appropriate position.

2. The patient should be transported to the most appropriate hospital.

3. When safe to do so, patients should be immediately evaluated, with particular attention to signs and symptoms of excited delirium.

4. Any injuries or medical conditions should be treated, refer to the appropriate off-line as needed.

5. These patients will be in the custody of law enforcement and will require transportation to an ED for medical clearance.

6. Unless otherwise contraindicated, the patient should be adequately and safely restrained in an upright position prior to transport.

7. For removal of the TASER probes:
   a. Verify the wires to the probe have been severed
   b. Use universal precautions
   c. Place one hand on the patient in the area where the probe is embedded and stabilize the skin surrounding the puncture site between two fingers. Keep your hand several inches away from the probe. With the other hand, in one fluid motion pull the probe straight out of the puncture site
   d. Place TASER probes in sharps container. If sharps container unavailable, reinsert TASER probes, point down, into the discharged air cartridge and hand it to the law enforcement officer.
   e. Apply direct pressure for bleeding, and apply a sterile dressing to the wound site.

Some signs and symptoms of extreme forms of behavioral disturbances may include: agitation, aggression, excitability, exertion, exhaustion, great strength, non-response to pain, fear, panic, paranoia, pre-existing medical problems, medication effects, and illicit drug use. Illegal drugs such as PCP, cocaine, methamphetamines and other stimulants are known to cause acute behavioral disturbances.
Fall Injury / Minor Injury / Lift Assist
Adult (≥ 18 y/o)

Assess the need for immediate spinal motion restriction. Refer to other off-lines as appropriate. Complete a patient encounter form.

1. Evaluate mental status
2. FAST assessment
3. Vital signs
4. Complete secondary – Assess movement and for any injury
5. Blood glucose
6. Orthostatic vital signs
7. Cardiac Monitor – if indicated

Determine cause of fall
• Syncope or near syncope
• Dizziness prior to fall
• Chest pain or difficulty breathing prior to fall
• Is patient normally ambulatory?
• Is this a mechanical fall? (i.e. did they trip, stumble, has a chronic balance issues, not using assistance device such as cane or walker, fall out of bed?)

Exclusion Criteria
A YES to any of the following requires on-line medical direction.
• Does the patient have a concurrent illness that caused the fall?
• Is the patient confused or lacking decision making capacity?
• Is there a history of recent falls? If patient lives independently, do they need additional intervention?
• Abnormal vital signs or positive orthostatic changes?
• Positive FAST score?
• Abnormal EKG - if being assessed by ALS provider?
• Abnormal blood glucose?
• Is patient on blood thinners? Compare to list. Aspirin alone does not require on-line medical direction.
• Secondary assessment reveals significant injury?

Risk assessment
• Assess patient’s residence for possible trip hazards and educate.
• Refusal (ensure pt understands potential risk.)
• If patient has POA, contact POA.
• Is patient safe to leave at home? Assure patient has responsible adult to stay with or check on patient. If someone is not at home with patient, contact friend/relative that is willing to check on patient.

Courtesy notification to receiving facility or contact on-line medical direction for high risk refusal.
**Initial medical care**
- Assess and treat the ABCDE’s
- Do not delay transport to an appropriate emergency facility for procedures.
- Complete as many procedures as possible enroute.
- Establish vascular access. If fluid replacement is needed 20cc/kg, repeat as needed.
- Immediate patients require two IV sites.

**Is the patient in pain?**
- No
- Yes

- Constant monitoring of ABCs and vital signs (including pulse oximetry) is required
- Please refer to Pain Management Off-line for medication and dosing.

**Do triage or treatment intervention problems exist?**
- No
- Yes

- Courtesy notification to receiving facility
- Contact Medical Control

**Head Injury**

1. Elevate the head of the board approximately 30 degrees.
2. Ensure pt ventilations adequate at age appropriate rate. (Assist with BVM if necessary)
3. Signs of severe traumatic brain injury (TBI) include unconsciousness and/or unresponsiveness; GCS < 9; pupils that are unequal, non-reactive, and/or dilated; oxygen saturation < 90% (adult); and/or systolic blood pressure < 90 mm Hg (adult).
4. Signs of impending cerebral herniation include all symptoms of TBI plus unresponsiveness to painful stimuli; extensor posturing; and/or a decrease by 2 or more point in the GCS. Other signs include Cushing's Triad: bradycardia, hypertension, and irregular respirations.
Spinal Motion Restriction
Blunt Trauma Adult (≥ 15 y/o)

Does the patient meet Adult Major Trauma Criteria with a BLUNT mechanism of injury (Trauma Triage)?

Yes

If the patient does not meet Major Trauma Criteria for Blunt Mechanism, does the patient have any of the following:
1. Altered mental status. For any reason including possible intoxication from alcohol or drugs (GCS < 15)
2. Age ≥ 65
3. Midline neck or back pain and/or tenderness
4. Focal neurologic signs and/or symptoms (ie. Weakness, tingling, or numbness)
5. Anatomic deformity of the spine
6. Painful distracting injury or circumstances (ie. Anything producing an unreliable physical exam)
7. High risk mechanism of injury associated with unstable spinal injuries that include, but are not limited to:
   a. Axial load (ie. Diving injury, spearing tackle)
   b. High speed MVC or rollover
   c. Pedestrian or bicyclist struck/collision
   d. Falls > 8feet/5 steps or patient’s height

No

Spine injury should be suspected and the patient should be placed in a properly fitted cervical collar and spinal movement minimized.

Patients without any of the above findings may be transported without the use of a cervical collar or any other means to restrict spinal motion.

• SMR may be achieved by use of a scoop stretcher, vacuum splint, ambulance stretcher, or long spine board with patient safely secured.
• SMR when indicated should apply to the entire spine due to risk of noncontiguous injuries. This can be accomplished by use of a cervical collar and placing the patient on a long backboard, scoop stretcher, vacuum splint, or ambulance stretcher.
• SMR cannot be properly performed with a patient in a sitting position.
• If elevation of the head is required, the device used to stabilize the spine should be elevated at the head while maintaining alignment of the neck and torso.
• There is no role for SMR in penetrating trauma.
Suspicion of a Traumatic Brain Injury (TBI) by mechanism, GCS, or Exam, then provide O2 15 L/min by NRB, establish IV access and monitor the patient’s O2, BP, and HR every 3-5 minutes.

## EPIC TBI Management

### Adult (≥ 15 y/o)

#### Airway/Breathing

<table>
<thead>
<tr>
<th>O2 sat&lt;90 &amp;/or hypoventilation (despite NRB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• BLS airway maneuvers</td>
</tr>
<tr>
<td>• BVM 10/min</td>
</tr>
<tr>
<td>• Careful monitoring of O2 sat and airway</td>
</tr>
<tr>
<td>• If O2 sat &lt;90, despite BLS consider ALS airway</td>
</tr>
<tr>
<td>• Maintain ETCO2 between 35-45 mmHg</td>
</tr>
</tbody>
</table>

#### Circulation

<table>
<thead>
<tr>
<th>SBP &lt;90 or other signs of shock</th>
</tr>
</thead>
<tbody>
<tr>
<td>• 1000 bolus of NS/LR</td>
</tr>
<tr>
<td>• Repeat 500 ml rapid boluses until SBP &gt;90</td>
</tr>
<tr>
<td>• Continue careful monitoring BP/HR</td>
</tr>
<tr>
<td>• Pay attention for early signs of shock:</td>
</tr>
<tr>
<td>• Tachycardia</td>
</tr>
<tr>
<td>• Dropping SBP</td>
</tr>
</tbody>
</table>

#### Disability

<table>
<thead>
<tr>
<th>Evaluate Mental Status/GCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always evaluate for hypoglycemia.</td>
</tr>
<tr>
<td>• It can mimic or cause a TBI.</td>
</tr>
<tr>
<td>• Check blood glucose. If &lt;70 mg/dl:</td>
</tr>
<tr>
<td>• Dextrose per Hypoglycemia off-line IV/I/O</td>
</tr>
<tr>
<td>• Repeat BG @ 10 min. Repeat previous dose X 1 if still &lt;70 mg/dl</td>
</tr>
</tbody>
</table>

#### Evaluate Mental Status/GCS

**Consider impending herniation if:**

- Dilated and unresponsive pupils
- GCS <9 or rapid deterioration in GCS by >2 points
- Extensor posturing
- Asymmetric pupils (one or both non-reactive to light)
- Re-evaluate every 3-5 minutes

**If patient has signs of impending herniation:**

- Elevate head of gurney 30°

**DO NOT hyperventilate**
Hemorrhage Control / Tourniquets

Apply Tourniquet for Primary Hemorrhage Control:
- Suspected life-threatening hemorrhage due to amputation or partial amputation
- Penetrating injuries proximal to the wrist/ankle with significant hemorrhage
- Potentially life-threatening hemorrhage as initial/primary treatment

Expose the bleeding site.
Apply the tourniquet as proximal as possible on the extremity.
Do NOT cross any joints with a tourniquet.
Tighten tourniquet until bleeding stops.
If distal pulse is still present, tighten tourniquet until pulse is not palpated.
The bigger the limb, the tighter the tourniquet will need to be to control bleeding.
Document time of application.

For non-life threatening hemorrhage or hemorrhage not amendable to tourniquet:
Apply direct manual pressure to bleeding site.
If continued bleeding, apply hemostatic gauze, if available.

If the first tourniquet is ineffective, a second tourniquet can be applied proximal to the first tourniquet.

Refer to Pain Management off-line, as needed.

Courtesy notification to receiving trauma center.

Contraindications to tourniquet use:
- Non-extremity hemorrhage (i.e., scalp, neck, thorax, etc.).
- Proximal extremity location where tourniquet application is not practical (i.e., high groin).

Precautions:
- A tourniquet applied incorrectly can increase blood loss.
- Applying a tourniquet can potentially cause nerve and tissue damage EVEN if applied correctly. Use only on appropriate patients.
- Injury due to tourniquet is unlikely if tourniquet is removed within two hours. In cases of life-threatening hemorrhage, the benefits outweigh the theoretical risk. Tourniquets may be removed if they are inappropriately placed, unnecessary for the wound, or are potentially damaging improvised tourniquets applied by bystanders.
- Only a commercially-made, Medical Direction-approved tourniquet should be used.
Acute Coronary Syndrome / Chest Pain / Anginal Equivalents
(non-traumatic) Adult (≥ 15 y/o)

Initial medical care and obtain 12 lead

Establish vascular access

IV successful?

Yes

If the patient is hypotensive (systolic < 90),
give one fluid challenge of 250 mL (if lungs
sounds clear)

Aspirin
2-4 baby aspirin (81 mg) by mouth if:
• No aspirin allergy
• Patient can chew and swallow

Nitroglycerin
0.4 mg sublingual tablets or spray
May be repeated 2 times, every 5 minutes, to
relief of pain if systolic >90

Morphine
2-4 mg increments IV up to 10 mg if systolic BP
>90 and chest pain unrelieved by nitroglycerin
OR
Fentanyl
IV: 1 mcg/kg, incremental doses, titrate
to effect, may repeat to max of 200
mcg total.
IM: 2 mcg/kg to a max of 200 mcg.
Intranasal: 2 mcg/kg to a max of 200 mcg.

No

Contact medical control if you believe the
patient would benefit from NTG
administration and no IV has been
established.

Note presence of ST-segment elevation
in 2 or more contiguous leads
• II, III, aVF – inferior wall
• I, aVL, V5, V6 – lateral wall
• V1, V2 – septum
• V3, V4 – anterior wall

Bradycardia with hypotension may be
due to inferior wall MI associated with
right ventricular MI. In this situation,
pacing and IV fluids may improve the
patient’s hemodynamic status. May
withhold MS or nitro if right ventricular MI
is suspected.

Consider risk factors:
• Gender
• Race
• Age
• Obesity

Document pertinent risk factors:
• Hypertension
• Smoking
• Family history
• High cholesterol
• Diabetes
• Lifestyle/stress

Document use/nonuse of sexual
enhancement drugs in past 48 hrs. obtain
On-line Medical Direction if <48 hrs
Levitra, Cialis, Viagra

Consider other treatment off-line where
appropriate.

Leave a copy of the 12 lead ECG when
transferring care.

Courtesy notification to closest
appropriate facility.
Symptomatic Bradycardia
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access and treat underlying causes

Persistent bradycardia causing:
• Hypotension
• ALOC
• Shock
• Ischemic chest discomfort
• Acute heart failure.

Monitor and observe

If Atropine is ineffective:
• Initiate transcutaneous pacing. Do not delay pacing for IV access. Consider sedation if systolic >90. Refer to Sedation Off-line, as needed.

OR
• Dopamine IV infusion: 2 to 10 mcg/kg/min
OR
• Epinephrine IV infusion: 2-10 mcg/min

Atropine
IV: 0.5 mg every 3 to 5 min; max 3mg

Yes

No

Establish vascular access and treat underlying causes

Monitor and observe

Courtesy notification to closest appropriate facility
Narrow Regular QRS Tachycardia
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access

Persistent Narrow Regular QRS tachycardia and causing:
- Hypotension
- ALOC
- Shock
- Ischemic chest discomfort
- Acute heart failure.

If possible WPW rhythm and hemodynamically stable, give:
**Amiodarone**: IV: 150 mg over 10 minutes

Avoid Adenosine, Diltiazem, and Verapamil with possible WPW

- Vagal maneuvers
- **Adenosine** IV: 6 mg rapid push followed with 20-mL NS flush. Second dose: 12 mg rapid push followed with 20-mL NS flush, if needed.

If rhythm persists and systolic BP >90: Give
**Diltiazem**: 15-20mg
IV: 0.25 mg/kg IV over 2 minutes.
Max 20mg per dose. Contact medical control for additional Diltiazem orders if rhythm persists.

OR
**Contact On-line Medical Direction for Verapamil**: 2-2.5mg slow IV over 1-2 minutes.

Synchronized cardioversion
- Initial recommended doses:
  * Narrow Regular Tachycardia: 50-100J biphasic or 200J monophasic
  * Narrow Irregular Tachycardia: 120-150J biphasic or 200J monophasic
- Consider sedation. Refer to Sedation Off-line, as needed.
- Consider **Adenosine**

• Narrow QRS = ≤ 0.10 sec

Courtesy notification to closest appropriate facility

• Narrow QRS = ≤ 0.10 sec
Atrial Fibrillation / Atrial Flutter
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access

Persistently Narrow irregular QRS tachycardia and causing:
• Hypotension
• ALOC
• Shock
• Ischemic chest discomfort
• Acute heart failure.

No

Yes

If possible WPW rhythm and hemodynamically stable, give:
**Amiodarone:** IV: 150 mg over 10 minutes

Avoid Adenosine, Diltiazem, and Verapamil with possible WPW

• Vagal maneuvers
• If rhythm persists and systolic BP >90: Give **Diltiazem:** 15 - 20mg
  IV: 0.25 mg/kg IV over 2 minutes.
  Max 20mg per dose. Contact medical control for additional **Diltiazem** orders if rhythm persists.

OR
**Contact On-line Medical Direction for Verapamil:** 2 - 2.5mg slow IV over 1-2 minutes.

Synchronized cardioversion
• Initial recommended doses:
  * Narrow Regular Tachycardia: 50-100J biphasic or 200J monophasic
  * Narrow Irregular Tachycardia: 120-150J biphasic or 200J monophasic
• Consider sedation. Refer to Sedation Off-line, as needed.

**Courtesy notification to closest appropriate facility**
Wide Complex Tachycardia
Adult (≥ 15 y/o)

Initial Medical Care

Establish vascular access

Persistent Wide Complex QRS tachycardia and causing:
- Hypotension
- ALOC
- Shock
- Ischemic chest discomfort
- Acute heart failure.

Magnesium Sulfate: IV: 2 grams over 10 min.

Is the rhythm regular and monomorphic?

No

Consider Adenosine IV: 6 mg rapid push followed with 20-mL NS flush. 2nd Dose: 12 mg rapid push followed with 20-mL NS flush, if needed. If Adenosine is ineffective or pt has suspected Vtach, then amiodarone or lidocaine may be given first.
- Amiodarone IV: 150 mg over 10 min.

OR
- Lidocaine IV: 1 to 1.5 mg/kg. May repeat with ½ initial dose every 5-10 minutes (max. 3 mg/ kg). If rhythm converts, initiate Lidocaine infusion at 1-4 mg/min unless rate is< 100 or QRS complex wide. Administer ½ usual maintenance infusion if age > 70, or if known liver disease.

Yes

• Initial recommended doses:
  * Wide Regular: 100J synchronized
  * Wide Irregular: defibrillation dose (not synchronized)
  • Consider sedation. Refer to Sedation Off-line, as needed.

No

Courtesy notification to closest appropriate facility

Yes

Courtesy notification to closest appropriate facility
CPR Quality
- Push hard (≥ 2 inches) and fast (≥ 100/minute) and allow complete chest recoil
- Minimize interruptions in compressions
- Avoid excessive ventilation
- Rotate compressor every 2 minutes
- If no advanced airway, 30:2 compression-ventilation ratio
- Quantitative waveform capnography. If <10, attempt to improve CPR quality

Return of Spontaneous Circulation (ROSC)
- Pulse and blood pressure
- Abrupt sustained increase in ETCO2 (typically >40)

Shock Energy
- Biphasic: Manufacturer recommendation (120-200 J); If unknown, use maximum available. Second and subsequent doses should be equivalent, and higher doses may be considered.
- Monophasic: 360J

Drug Therapy
- Epinephrine IV/IO Dose: 1 mg (1:10,000) every 3-5 minutes
- Amiodarone IV/IO Dose: First dose 300 mg bolus. Second dose 150 mg bolus. If Amiodarone is unavailable, Lidocaine IV/IO Dose: 1-1.5 mg/kg, repeat 1/2 initial dose (0.5-0.75 mg/kg). Max 3 mg/kg

Advanced Airway
- Supraglottic advanced airway or endotracheal intubation
- Waveform capnography to confirm and monitor ET tube placement
- Once advanced airway is in place, give 1 breath every 6 seconds, with continuous compressions.

Reversible Causes
- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

© 2015 American Heart Association
Post-Arrest Stabilization
Adult (≥ 15 y/o)

OUT-OF-HOSPITAL CARDIAC ARREST

Assess Airway and Ventilations
Re-Confirm ETT
Maintain ETCO2 @ 35-45 with oxygen, as appropriate.

Assess Pulse and Rhythm:
Consider antiarrythmic drip therapy and assess BP

Is the patient hypotensive?

Yes

Fluid Bolus 10-20 cc/kg NS or LR
Monitor Response
Reassess V/S: What is BP?
Still Hypotensive?

Consider
- Further Fluid Bolus
Or
- Dopamine Infusion (2-10 mcg/kg/min)
Or
- Epinephrine Infusion (2-10 mcg/min)
Infusions titrated to desired effects

V/S Improve: BP @90-100mm systolic

Assess Glucose Level: Below 60
Administer Dextrose:
12.5 - 25 gms IV/IO
125-250 mL IV/IO

Seizure Control:
Refer to seizure off-line

Consider cooling measures
Consider ongoing sedation. Refer to Sedation Off-line, as needed.

No

Assess Glucose Level: Below 60
Administer Dextrose:
12.5 - 25 gms IV/IO
125-250 mL IV/IO

Seizure Control:
Refer to seizure off-line

Consider cooling measures
Consider ongoing sedation. Refer to Sedation Off-line, as needed.

Transport to a CRC when feasible, resources available, and will add less than 15 minutes to transport time compared to transport to non-CRC.

Courtesy notification to closest appropriate facility

• Cyanosis
## Neonatal Resuscitation

### All situations:
- Consider immediate transport
- Assess and support the following:
  - Temperature (dry and warm)
  - Airway (position and suction)
  - Breathing (stimulate to cry)
  - Circulation (heart rate and color)
- What is the respiratory status and heart rate?

### Stable Newborn
- Respirations are adequate, heart rate > 100/min, central color pink
- Continue assessment
- Observe, monitor vital signs, support, and transport
- Courtesy notification to receiving facility

### Unstable Newborn

Formulas for weight, BP, ETT size, and ETT depth for ≥ 1 yr

- Weight (kg) = 8 + (2 x years)
- ETT size = \[
\frac{16 + \text{years}}{4}
\]
- May use cuffed or uncuffed ETT
- BP = (2 x years) + 70 = minimum systolic
- ETT depth = 10 + years = cm at lips

## Probable sinus tachycardia

- Compatible history consistent with known causes.
- P waves present/normal
- Variable R-R; consistent PR
- Infants: rate usually <220/min
- Children: rate usually <180/min

## Probable SVT

- Compatible history (vague, nonspecific); history of abrupt rate changes
- P waves absent/abnormal
- HR not variable
- Infants: rate usually >220/min
- Children: rate usually >180/min

Updated November 9, 2016
Nausea / Vomiting
Pediatric (≤14 y/o)

Initial Medical Care

Establish vascular access

Administer **Ondansetron**
- <40 kg 0.1 mg/kg, IV slow over 2-5 minutes or IM
- >40kg 4 mg IV slow over 2-5 minutes or IM

May give **Ondansetron**
- Oral Dissolving Tablet or give PO
  - <40 kg 0.1 mg/kg
  - >40kg 4 mg

PO dose may be given by breaking ODT tablet or giving IV solution PO

Courtesy notification to receiving facility
Allergic Reaction/Anaphylaxis
Pediatric (≤14 y/o)

Initial medical care

Establish vascular access to maintain age/weight appropriate BP. Do not delay treatment while establishing vascular access.

Anaphylaxis
- Shock, “looks sick”
- Severe facial angioedema
- Severe respiratory distress
- Drooling

Acute Allergic Reaction
Rash, mild swelling

Epinephrine
IM: 0.01 mg/kg (0.01 mL/kg) (1:1,000 solution) – max 0.5 mg (0.5 mL) per dose

Diphenhydramine (Benadryl)
IV/IO/IM: 1.0 mg/kg (max dose 50 mg)

Methylprednisolone (Solu-Medrol)
IV/IM: 2 mg/kg (max 125 mg)

Consider Albuterol (Proventil)
SVN: 2.5 mg in 3.0 mL NS for respiratory distress; repeat as needed

If severe respiratory distress, refer to anaphylaxis treatment.

Diphenhydramine (Benadryl)
IVIM: 1.0 mg/kg (max dose 50 mg)

Methylprednisolone (Solu-Medrol)
IV/IM: 2 mg/kg (max 125 mg)

Consider Albuterol (Proventil)
SVN: 2.5 mg in 3.0 mL NS for respiratory distress; repeat as needed

If severe respiratory distress, refer to anaphylaxis treatment.

Mild Distress:
- Itching, isolated urticaria, nausea, no respiratory distress

Severe Distress:
- Stridor, bronchospasm, severe abdominal pain, sudden unexplained cardiovascular collapse in a previously normal patient, respiratory distress, tachycardia, shock, generalized urticaria, edema of lips, tongue or face (angioedema)

Courtesy notification to receiving facility
Respiratory Distress
Pediatric (≤14 y/o)

Initial medical care

Stridor
Epinephrine
Give SVN epinephrine 1:1,000 2.5 -5.0 mg diluted in 3 mL NS
=/< 4 y/o deliver 2.5 mg diluted in 3cc of NS
=/> 5 y/o deliver 5.0 mg diluted in 3cc of NS

Wheezes Bronchospasm
Albuterol (Proventil)
SVN: Give SVN 2.5 mg in 3.0 mL NS. Repeat as needed, based on assessment.

Ipratropium bromide (Atrovent)
SVN: May use Atrovent 500 mcg instead of NS with Albuterol. Max of 3 doses.

Respiratory Arrest or Failure
Establish vascular access
Treat underlying cause
Treat respiratory distress/arrest as needed

Methylprednisolone (Solu-Medrol)
2 mg/kg IV or IM. Max of 125mg.

Magnesium Sulfate IV:
25-50 mg/kg in 50 ml of N/S over 20 minutes

Courtesy notification to receiving facility

If patient is unstable, consider use of Epinephrine IM:
0.01 mg/kg (0.01 mL/kg) (1:1,000 solution) – max 0.5 mg (0.5 mL) per dose
Altered Neurological Function (Non-trauma) Pediatric (≤14 y/o)

Initial medical care

Establish vascular access

Check blood glucose
Is level < 50 mg/dL?
(< 40 mg/dL for neonate)

No

Consider Naloxone
IV/IO/IM/IN/ SC/ET: 0.1 mg/kg (includes neonate); max 2.0 mg per dose

- Repeat dose of Naloxone needed
- Naloxone unavailable (use of Nalmefene in a child requires online Medical Direction)

Contact medical control if:

Yes

Refer to Hypoglycemia Off-line

Courtesy notification to receiving facility

- Arizona Opioid Assistance and Referral Line: 1-888-688-4222 Free and confidential. Translation services available.
Hypoglycemia
Pediatric (Patients < 15 y/o)

This protocol is used for patients with hypoglycemia. Consider history and refer to appropriate guidelines as necessary (seizures, altered mental status, tachycardia).

**Initial medical care**

Establish vascular access

Check blood glucose. Is level < 60 mg/dL?

- Yes
- No

Refer to appropriate off-line

If the patient is awake, alert, and has a patent airway, 0.5-1 gm/kg of oral glucose may be given.

**Dextrose**: D10 5mL/kg (0.5 gm/kg) IV, max dose 250 mL

If no IV, Administer Glucagon:
- 1 mg IM if > 20 kg or > 5 yo
- 0.5 mg IM if < 20 kg or < 5 yo

Recheck blood glucose.

- Courtesy notification to receiving facility

On line medical direction is required for high risk refusal.

High risk patients for recurrent hypoglycemia:
- Use of long-acting insulin agents (Lantus, Levemir, NPH)
- Complicating factors (seizure, concern for intentional overdose, fever, other medical complaints)
- Use of oral diabetic medications, specifically sulfonfonyureas (glipizide, glyburide, glipcotol, diabeta, glimepiride, amaryl, diabinese, tolinase, micronase, orinae, tol-tab, glycron, duatact, glnasel prestab, glucovance, avandaryl, chlorptopamide, metaglip, tolbutamide, tolazamide etc.)

If patient is refusing transport, remain on-scene to ensure that patient eats. Do not release patient unless blood sugar > 80.

*Dextrose 10% = 4:1 dilution of dextrose 50%*

To prepare D10: Use a 250 mL IV bag of normal saline. Waste 50 mL and add 50 mL of dextrose 50%. The resulting solution is dextrose 10% in normal saline or 1 g/10 mL.
Brief Resolved Unexplained Event (BRUE) / Apparent Life-Threatening Event (ALTE) Pediatric (≤2 y/o)

**Initial medical care.**
Perform a comprehensive physical exam that includes the general appearance of the child, skin color, extent of interaction with environment, and evidence of trauma.

**Consider vascular access**

**Check blood glucose. Is level < 50 mg/dL?**
(< 40 mg/dL for neonate). Refer to other off-lines if appropriate.

**Treat any identifiable causes**

**Courtesy notification to receiving facility.** These patients should be transported or contact on-line medical direction for high-risk refusal.

**DEFINITION:**
1. A Brief Resolved Unexplained Event (BRUE) was formally known as Apparent Life-Threatening Event (ALTE) or as a “near-miss SIDS” episode.
2. A BRUE is an episode that is frightening to the observer (may think the infant has died) and involves some combination of:
   a. Cyanosis or pallor (Color change including: erythema, plethora)
   b. Absent, decreased, or irregular breathing (apnea: central or obstructive, including choking or gagging)
   c. Marked change in muscle tone (hyper or hypotonia)
   d. Altered level of responsiveness
3. Usually occurs in infants < 12 months old, however, any child less than 2 years old who exhibits the symptoms above may be considered a BRUE.
4. Most have a normal physical exam when assessed by responding field personnel
5. 50–60% have no known etiology
6. 40–50% have an identifiable etiology (e.g. child abuse, SIDS, swallowing dysfunction, infection, bronchiolitis, seizures, CNS anomalies, tumors, cardiac disease, chronic respiratory disease, upper airway obstruction, metabolic disorders, or anemia)

**DOCUMENTATION**
1. Assume the description of the symptoms is accurate
2. Determine the severity, nature and duration of the episode was the patient awake or asleep at the time of the episode details of the resuscitation required
3. Obtain a medical history
   a. known chronic diseases
   b. evidence of seizure activity
   c. current or recent infections
   d. gastroesophageal reflux
   e. recent trauma or suspected non-accidental trauma
   f. inappropriate mixture of formula
   g. medication history (current and recent)
Seizures
Pediatric (≤14 y/o)

Initial medical care

Consider causes
If blood glucose level < 50 mg/dL, refer to altered neurological off-line.

• For ongoing seizure or seizure lasting > 5 minutes, more than two seizures in one hour, or status epilepticus
• If seizure persists, may repeat IM dose once in 10-15 minutes
• For IN dose, use a MAD, Midazolam 5 mg/mL concentration, & split dose between nostrils

Midazolam 0.2 mg/kg IM/IN
If < 40 kg, max dose = 5 mg IM/IN
If > 40 kg, max dose = 10 mg IM/IN

Lorazepam, Midazolam, or Diazepam, IV 0.1 mg/kg IV
Administer slowly over 2 minutes
Max single dose 4 mg
Max of two doses, regardless of route.

Courtesy notification to receiving facility

Note: Febrile seizures typically occur in children between 6 months and 6 years of age. Febrile seizures are usually of short duration (lasting less than 15 minutes) and usually do not require anti-seizure medication therapy. Valium should only be used if Ativan or Versed are unavailable.
Adrenal Insufficiency
Pediatric (≤14 y/o)

Initial medical care

Establish vascular access

- Administer supplemental oxygen, titrate oxygen to \( \text{SaO}_2 \geq 94\% \)
- If hypotensive or no palpable pulse, administer boluses 10-20 cc/kg of NS or LR as long as lungs remain clear and systolic BP < 90. Use caution if patient has a end stage renal disease or CHF (refer to Shock/Hypotension guideline)
- Correct blood glucose if < 60 mg/dl (refer to Hypoglycemia guideline)

Cardiac monitor

Stress dose steroids:
- Assist patient with home medication: hydrocortisone (Solu-Cortef).
  Child: 2 mg/kg IM or
  0 – 3 yo = 25 mg IM
  3 – 12 yo = 50 mg IM
  ≥ 12 yo = 100 mg IM
- Stress dose steroids (if home medication not available):
  - Methylprednisolone 2 mg/kg IV (max 125mg)

Courtesy notification to closest appropriate facility

Includes patients with a known medical history of adrenal insufficiency, such as Congenital adrenal hyperplasia (CAH), Panhypopituitarism, Long-term use of steroids (replacement therapy, asthma, COPD, rheumatoid arthritis, and transplant recipients), who are presenting with Illness or injury, including but not limited to:
- Shock/hypoperfusion
- Fever > 100.4°F
- Multi-system trauma
- Multiple long bone fractures
- Hyperthermia or hypothermia
- Respiratory distress
- Partial or full thickness burns > 5% BSA
- Drowning
- Vomiting/Diarrhea with signs/symptoms of dehydration
Poisoning/Overdose
Pediatric (≤14 y/o)

Initial medical care (including ECG monitoring)

Establish vascular access

Inspect the scene.
Collect containers for transport to receiving facility.
Contact Poison Control (602-253-3334) for advice, if needed. Treatment orders must be obtained from medical direction physician.

Courtesy notification to receiving facility

Document:
- Type of ingestion (What, when, how much)
- Past history (medications, suicide attempts)
- Action taken by bystanders (induced emesis? “Antidote” given?)
- Try to bring in info on substance ingested including packaging/pills to receiving center.
Shock/Hypotension
Pediatric (≤14 y/o)

Initial medical care

Establish vascular access; bolus with 20 mL/kg if lungs are clear. May repeat x 2, as needed, to maintain BP appropriate for age (or per Broselow tape). Use caution if patient has end stage renal disease or CHF.

Check blood glucose - if < 50 mg/dL, refer to appropriate algorithm.

Courtesy notification to closest appropriate facility.

Sepsis Alert
The purpose of a sepsis alert is to provide pre-arrival Emergency Department notification in order to facilitate rapid assessment and ongoing treatment of a patient with suspected severe sepsis. These cases must be recognized early and treated aggressively to prevent progression to shock and death.

Your patient meets SEPSIS CRITERIA if conditions 1 + 2 are present.
Your patient meets SEVERE SEPSIS CRITERIA if conditions 1 + 2 + 3 are present.

A sepsis alert will be activated en route to the receiving facility for either of the above scenarios. A hospital’s specific response to sepsis alerts will vary depending on resources and internal protocols.

**Initial Medical Care**

1. Obtain focused history and perform assessment

**Suspected Infection**
- Temperature abnormality on assessment or within 4 hours of assessment
- Open wounds, sores, cellulitis
- UTI
- Pneumonia
- Meningitis

**High-Risk Criteria**
- Malignancy
- Asplenia or sickle cell disease
- Bone marrow transplant
- Indwelling medical device
- Solid organ transplant
- Severe intellectual disability or cerebral palsy
- Immunocompromise, chronic steroid use

**Clinical Criteria** (2 or more criteria)

**Septic Shock Trigger** (at least one)
- SBP < 70 + (age in yr X 2)
- 3 or more clinical criteria
- 2 or more clinical criteria in patient meeting high-risk criteria

**Treatments**
- Supplemental oxygen to maintain saturations ≥ 92%
- Attempt IV access. Do not delay transport if unsuccessful. Consider IO placement for patients meeting SEVERE SEPSIS CRITERIA.
- Administer boluses of 20 cc/kg NS over 20 minutes as long as lungs remain clear
  – Use caution if patient has end-stage renal disease or CHF

**Notify closest appropriate facility of SEPSIS ALERT, if applicable**
Pain Management
Pediatric (≤14 y/o)

Initial medical care

Establish vascular access

Is the BP normotensive?

Yes

Constant monitoring of ABCs and vital signs (including pulse oximetry) is required

Morphine for analgesia
IV: 0.1 mg/kg. May repeat to a total max dose of 0.2 mg/kg. Max total dose of 10 mg.

Or
Fentanyl
IV: 1 mcg/kg slow, maximum incremental dose of 50mcg, may repeat to max of 200 mcg total.
Intranasal: 1-2 mcg/kg, maximum incremental dose of 50mcg, to a max of 200 mcg.

No

Proceed with appropriate algorithm

Before administering meds for pain, ask the patient to quantify their pain on a 1 to 10 scale. Document this information and use it as a guide to measure the effectiveness of analgesia.

**IV route offers better means for titration of med. Absorption via IM route may be unpredictable and should be used as a last resort – use only if no vascular access. Documentation must reflect rationale for IM route, if used.
Sedation
Pediatric (≤14 y/o)

Sedation should only be administered when indicated in specific off-line.

<table>
<thead>
<tr>
<th>Sedation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lorazepam (Ativan)</td>
</tr>
<tr>
<td>0.05-0.1 mg/kg IV/IM over 2-5 minutes (maximum 4mg). May repeat in 10-15 minutes.</td>
</tr>
<tr>
<td>Or</td>
</tr>
<tr>
<td>Midazolam (Versed)</td>
</tr>
<tr>
<td>IV: 0.05 to 0.1 mg/kg slow IV push</td>
</tr>
<tr>
<td>IM: 0.2 mg/kg. Max of 10mg every 10 minutes up to total dose of 20 mg</td>
</tr>
<tr>
<td>Intranasal: 0.2-0.3 mg/kg. Max 10mg</td>
</tr>
<tr>
<td>Or</td>
</tr>
<tr>
<td>Diazepam (Valium)</td>
</tr>
<tr>
<td>IV: 0.2-0.3 mg/kg every 15-30 minutes max of 1 mg/kg not to exceed 10 mg per dose; administer IV over at least 3 minutes.</td>
</tr>
</tbody>
</table>

Special Considerations

- If other CNS depressants, including alcohol and benzodiazepines, are on board, decrease dose
- Sedation has been associated with respiratory depression and respiratory arrest. Monitor patient closely with cardiac monitor, SPO2 and ETCO2, if available
Trauma Management
Pediatric (≤14 y/o)

Initial medical care
Assess and treat the ABCDE’s
Do not delay transport to an appropriate emergency facility for procedures.
Complete as many procedures as possible enroute.
Establish vascular access. If fluid replacement is needed 20cc/kg, repeat as needed.
Immediate patients require two IV sites.

Is the patient in pain?

No

Constant monitoring of ABCs and vital signs
(including pulse oximetry) is required

Please refer to Pain Management Off-line for
medication and dosing.

Yes

Do triage or treatment intervention problems exist?

No

Courtesy notification to receiving facility

Yes

Contact Medical Control

Head Injury
If patient has head injury:
1. Elevate the head of the board approximately 30 degrees.
2. Ensure pt ventilations adequate at age appropriate rate. (Assist with BVM if necessary)
3. Signs of severe traumatic brain injury (TBI) include unconsciousness and/or unresponsiveness;
   GCS < 9; pupils that are unequal, non-reactive, and/or dilated; oxygen saturation < 90%;
   and/or hypotension.
4. Signs of impending cerebral herniation include all symptoms of TBI plus unresponsiveness to
   painful stimuli; extensor posturing; and/or a decrease by 2 or more point in the GCS. Other
   signs include Cushing’s Triad: bradycardia, hypertension, and irregular respirations.
Spinal Motion Restriction
Blunt Trauma Pediatric (≤14 y/o)

Does the patient meet Pediatric Major Trauma Criteria with a BLUNT mechanism of injury (Trauma Triage)?

Yes
If the patient does not meet Major Trauma Criteria for Blunt Mechanism, does the patient have any of the following:
1. Altered mental status – for any reason including possible intoxication from alcohol or drugs, includes agitation, apnea, hypopnea, somnolence (GCS < 15)
2. Midline neck or back pain and/or tenderness
3. Focal neurologic signs and/or symptoms (ie. Weakness, tingling, or numbness)
4. Anatomic deformity of the spine
5. Torticollis
6. Painful distracting injury or circumstances (ie. Anything producing an unreliable physical exam)
7. High risk mechanism of injury associated with unstable spinal injuries that include, but are not limited to:
   a. Axial load (ie. Diving injury, spearing tackle)
   b. High speed MVC or rollover
   c. Pedestrian or bicyclist struck/collision
   d. Falls > 8 feet/5 steps or patient’s height
   e. Substantial torso injury

Yes
Spine injury should be suspected and the patient should be placed in a properly fitted cervical collar and spinal movement minimized.

No
Patients without any of the above findings may be transported without the use of a cervical collar or any other means to restrict spinal motion.

- SMR may be achieved by use of a scoop stretcher, vacuum splint, ambulance stretcher, or long spine board with patient safely secured.
- Children may require additional padding under the shoulders to avoid excessive cervical spine flexion with SMR.
- Minimize time on backboards.
- SMR cannot be properly performed with a patient in a sitting position.
- If elevation of the head is required, the device used to stabilize the spine should be elevated at the head while maintaining alignment of the neck and torso.
- There is no role for SMR in penetrating trauma.
Suspicion of a Traumatic Brain Injury (TBI) by mechanism, GCS, or Exam, then provide O2 15 L/min by NRB, establish IV access and monitor the patient’s O2, BP, and HR every 3-5 minutes.

### Airway/Breathing

**O2 sat<90 &/or hypoventilation (despite NRB)**

- BLS airway maneuvers
- BVM:
  - Infants: (0-24 months): 25 bpm
  - Children: (2-14 yr): 20 bpm
  - Adolescents: (15-17): 10 bpm
- Careful monitoring of O2 sat and airway
- If O2 sat <90, despite BLS consider ALS airway.
- Maintain ETCO2 between 35-45 mmHg

### Circulation

**Hypotension or other signs of shock**

- 20ml/kg bolus NS
- Repeat until hypotension resolves
- Continue careful monitoring BP/HR
- Pay attention for early signs of shock:
  - Tachycardia
  - Dropping SBP

#### Identifying Hypotension

- 0-9 yrs: 70 + (age x 2)
- ≥10 yrs: < 90mmHg

### Disability

**Evaluate Mental Status/GCS**

- Always evaluate for hypoglycemia.
  - It can mimic or cause a TBI.
  - Check blood glucose. If <70 mg/dl:
    - Administer Dextrose: 0.5 to 1.0 g/kg slowly: 5 to 10 mL/kg 10%
    - Repeat BG @ 10 min. Repeat previous dose X 1 if still <70 mg/dl

- Consider impending herniation if:
  - Dilated and unresponsive pupils
  - GCS <9 or rapid deterioration in GCS by >2 points
  - Extensor posturing
  - Asymmetric pupils (one or both non-reactive to light)
  - Re-evaluate every 3-5 minutes

**If patient has signs of impending herniation.**

- Elevate head of gurney 30°

**DO NOT hyperventilate**

### If O2 sat <90, despite BLS consider ALS airway

- Place advanced airway
  - Pre-oxygenate: BVM with 100% O2 @ age-appropriate rate
  - Check placement using ETCO2 detector and/or monitor
- Avoid even moderate hyperventilation
  - Control ventilatory rate:
    - ETCO2 available: maintain ETCO2 between 35-45 mmHg
    - ETCO2 not available: utilize cadence device for rate
  - Control ventilatory volume:
    - Ventilator available: utilize as soon as possible (Tidal volume = 7cc/kg)
    - Ventilator not available: utilize pressure controlled bag
- Monitor O2 sat and airway every 3-5 minutes
  - If O2 sat <90, despite above interventions, consider:
    - Tension pneumothorax and needle thoracostomy
- Meds that can rapidly drop BP and rapidly reduce blood flow to brain: Morphine, Fentanyl, Midazolam (Versed), Diazepam (Valium), Lorazepam (Ativan). Use with caution and watch SBP carefully. Don’t give if patient’s B/P is already low or falling. Start with VERY low doses- (20-25% of usual dose.)
Symptomatic Bradycardia
Pediatric (≤14 y/o)
With a Pulse and Poor Perfusion

Initial Medical Care

Establish vascular access and treat underlying causes

Cardiopulmonary compromise continues?

No

Monitor and observe
• Support ABC’s
• Give oxygen

CPR if Heart <60/minute

Yes

• Epinephrine IV: 0.01 mg/kg (0.1 ml of 1:10,000). Repeat every 3-5 minutes. If IV/IO access is not available, but an endotracheal tube is in place, may give Epinephrine ETT: 0.1 mg/kg (0.1 ml/kg of 1:1,000)
• Atropine for increased vagal tone or primary AV block. IV: 0.02 mg/kg. May repeat once. Minimum dose 0.1 mg and maximum single dose is 0.5 mg.
• Consider transthoracic pacing. Consider sedation, refer to Sedation Off-line, as needed.
• Treat underlying causes

Cardiopulmonary Compromise
• Hypotension
• Acutely altered mental status
• Signs of shock

If pulseless arrest develops, go to Cardiac Arrest Algorithm.

 Courtesy notification to closest appropriate facility

 Courtesy notification to closest appropriate facility
Tachycardia
Pediatric (≤14 y/o)
With a Pulse and Poor Perfusion

Initial Medical Care

Establish vascular access and treat underlying causes

Evaluate the QRS. Is it wide or narrow?

Narrow (≤0.09 seconds)

Evaluate rhythm with a 12 Lead ECG

Probable sinus tachycardia.
- Search for and treat cause.

Probable SVT
- Consider vagal maneuvers
- If IV/IO give Adenosine IV/IO 0.1 mg/kg rapid bolus. (Max first dose 6 mg). May repeat IV/IO: 0.2 mg/kg rapid bolus. (Max second dose 12 mg)
- If no IV/IO access, or if Adenosine is ineffective, synchronized cardioversion with 0.5 to 1.0 J/kg; 2 J/kg if rhythm persists.
- Consider sedation, but do not delay cardioversion. Refer to Sedation Off-line, as needed.

Wide >0.09 seconds

Possible ventricular tachycardia

Cardiopulmonary Compromise
- Hypotension
- Acutely altered mental status
- Signs of shock

No

- If rhythm is regular and monomorphic, consider Adenosine IV/IO: 0.1 mg/kg rapid bolus. (Max first dose 6 mg). May repeat IV/IO: 0.2 mg/kg rapid bolus. (Max second dose 12 mg)
- If rhythm persists, obtain On-line Medical Direction for consideration of Amiodarone IV/IO: 5 mg/kg over 20 minutes.

Yes

- Consider sedation, but do not delay cardioversion. Refer to Sedation Off-line, as needed.
- Synchronized cardioversion with 0.5 to 1.0 J/kg; 2 J/kg if rhythm persists.

Courtesy notification to closest appropriate facility
**CPR Quality**
- Push hard (≥ 1/3 of anterior-posterior diameter of chest) and fast (100-120/min) and allow complete chest recoil
- Minimize interruptions in compressions
- Avoid excessive ventilation
- Rotate compressor every 2 minutes, sooner if fatigued
- If no advanced airway, 15:2 compression-ventilation ratio
- Quantitative waveform capnography. If <10, attempt to improve CPR quality

**Shock Energy for defibrillation**
- First shock 2 J/kg, second shock 4 J/kg, subsequent shocks ≥ 4 J/kg, maximum 10 J/kg or adult dose.

**Drug Therapy**
- **Epinephrine IV/IO Dose:** 0.01 mg/kg (0.1 mL/kg) of 1:10,000. Repeat every 3-5 minutes if no IV/IO access, may give Epinephrine ETT: 0.1 mg/kg (0.1 mL/kg of 1:1,000)
- **Amiodarone IV/IO Dose:** 5 mg/kg bolus during cardiac arrest. May repeat up to 2 times for refractory VF/pulseless VT. If Amiodarone is unavailable, **Lidocaine IV/IO Dose:** 1mg/kg.

**Advanced Airway**
- Endotracheal intubation or supraglottic advanced airway
- Waveform capnography to confirm and monitor ET tube placement
- Once an advanced airway is in place, give 1 breath every 6 seconds (10 breaths/minute) with continuous chest compressions

**Return of Spontaneous Circulation (ROSC)**
- Pulse and blood pressure

**Reversible Causes**
- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

---

©2015 American Heart Association
Post-Arrest Stabilization
Pediatric (≤14 y/o)

OUT-OF-HOSPITAL CARDIAC ARREST

Assess Airway and Ventilations
Re-Confirm ETT
Maintain ETCO2 @ 35-45 and Ventilations @ 12/minute with 100% O2

Assess Pulse and Rhythm:
Consider Antiarrythmic Drip Therapy and assess BP

Is the patient hypotensive?

Fluid Bolus 10-20 cc/kg NS or LR
Monitor Response
Reassess V/S: What is BP?
Still Hypotensive?

Consider Further Fluid Bolus
Consider:
Epinephrine Infusion: 0.1mcg/kg/min
Or
Dopamine Infusion: 2-10 mcg/kg/min
Infusions Titrated to desired effects

V/S Improve: BP Age Specific

Assess Glucose Level: Below 50
Dextrose*
IV/IO: 0.5 to 1.0 g/kg slowly:
5 to 10 mL/kg 10%
Repeat Glucose check

Seizure Control:
Refer to seizure off-line

Consider cooling measures

Consider ongoing sedation. Refer to Sedation off-line, as needed.

Courtesy notification to closest appropriate facility.
Contact medical control, if needed.

Transport to a facility that has a PICU, when feasible.
Trauma Triage

Step 1
Measure vital signs and level of consciousness
Glasgow Coma Scale: ≤13
Systolic Blood Pressure (<90 mmHg in adults)
Respiratory Rate: <10 or >29 breaths per minute, or need for ventilatory support (<20 in infant aged <1 year)

Step 2
Assess anatomy of injury
• All penetrating injuries to head, neck, torso, and extremities proximal to elbow or knee
• Chest wall instability or deformity (e.g. flail chest)
• Two or more proximal long-bone fractures
• Crushed, degloved, mangled, or pulseless extremity
• Amputation proximal to wrist or ankle
• Pelvic fractures
• Open or depressed skull fracture
• Paralysis

Step 3a
• Ejection (partial or complete) from automobile
• Motorcycle crash >20 mph
• Patient run over, or with significant impact (>20 mph)

Step 3b
• Falls
  - Adults: >20 feet (one story is equal to 10 feet)
  - Children: >10 feet or 2-3 times the height of the child
• High-risk auto crash
  - Intrusion, including roof: >12in. occupant site; >18in any site. Intrusion refers to interior compartment intrusion, as opposed to deformation which refers to exterior damage.
  - Death in same passenger compartment
• Auto vs. pedestrian/bicyclist (NOT run over or thrown, with less than 20mph impact)

Step 4
Assess special patient or system considerations
• Older Adults
  - Risk of injury/death increases after age 55 years
  - SBP <110 may represent shock after age 65
  - Low impact mechanisms (e.g. ground level falls) may result in severe injury
• Children
  - Should be triaged preferentially to pediatric capable trauma centers
• Anticoagulants and bleeding disorders
  - Patients with head injury are at high risk for rapid deterioration
• Burns
  - Without other trauma mechanism: triage to burn facility
  - With trauma mechanism: triage to trauma center
• Pregnancy >20 weeks
• EMS provider judgment

Yes
Transport to a Level 1 Trauma Center. Steps 1 and 2 attempt to identify the most seriously injured patients. These patients should be transported preferentially to the highest level of care within the defined trauma system.

Consider Transport to a Level 1 or 3 Trauma Center. Consider age, co-morbidities, and special considerations. Obtain On-line Medical Direction with receiving facility if Level 3, or CN to Level 1.

When in doubt, transport to a Level 1 trauma center.
Pediatric trauma patients, requiring Level 1 trauma care, are to be triaged preferentially to pediatric capable trauma centers.
**Burn Triage**

**Does The Patient Have Any Of The Following?**

1. Partial thickness burns > 10% TBSA
2. Any full thickness burns of any age group
3. Burns that involve the face, hands, feet, genitalia, perineum, or major joints
4. Electrical burns including lightning injury
5. Chemical burns
6. Inhalation injury
7. Burn injury with pre-existing medical disorders: CHF, ESRD, COPD, or cardiac that could complicate management, prolong recovery, and affect mortality
8. Burns with concomitant trauma (such as fractures)
9. Pediatric burns, especially requiring ICU care
10. Burn injury in patients who will require special social, emotional or long term rehabilitation
11. Circumferential Burns

**No**

- Courtesy notification to receiving facility of patient’s choice.

**Yes**

- Prepare patient for transport to burn center
  1. Estimate total body surface area (TBSA) burned using “Rule of Nines”
  2. Give fluid replacement: Parkland Formula (Lactated Ringers preferred) 4cc/LR X Kg/wgt X TBSA=fluids required for 24 hour period. Administer ½ total volume in the first 8 hour.
  3. Airway 100 % oxygen for all burn patients 2 large bore IV’s
  4. Dress patient in dry dressings and keep patient warm
  5. Pain Management Morphine Sulfate IV (per protocols)

- Courtesy notification to Maricopa Medical Center
Identifying Priority Patients (MAPP)

“A map won’t show you every bump in the road, but it will get you there.”

Mechanism
- Fall injury
- Entrapment
- Explosion
- Electrocution
- MVA (ROS, seatbelt, intrusion, airbag deploy, car size, rollover, steering wheel, impact site, glass intact)
- Burn (thermal, chemical)
- Poisoning/overdose
- Water-related incident
- Choking / FBAO
- Ejection from motor vehicle (including motorcycles, mopeds, ATV's, or the open bed of pick-up trucks, etc.).

Anatomy
- Penetrating trauma
- Blunt trauma
- Fracture
- Burns
- Major soft tissue injury
- Gross deformity
- Injury to eyes, hands, feet, genitalia

Physiology
- Altered mental status
- Bradycardia, tachycardia
- Nausea/vomiting
- Sweating
- Shortness of breath
- Chest pain
- Headache
- Severe pain
- Hypotension
- Respirations < 10 or > 40
- Fever > 101
- Abdominal pain
- Inability to walk

Patient Factors
- Age <5 or >55
- Cardiac disease
- Respiratory disease
- Seizure disorder
- Insulin-dependent diabetes
- Cirrhosis
- Morbid obesity
- Pregnancy
- Immunosuppressed patients
- Patients with bleeding disorder or patient on anticoagulants
- + use of alcohol/drugs
- Recent surgery/illness
Cardiopulmonary Arrest - Blunt Trauma
Adult (≥ 18 y/o)

Initial medical care

Yes

Signs of irreversible death?*

No

Manage airway and breathing

Apply monitor

Asystole/Agonal in 2 leads

Consider termination**

**Consider time of arrest, mechanism: blunt vs. penetrating trauma, possible underlying medical cause

- Initiate grief support
- Notify PD
- Remain with patient until PD arrival

Pulseless VT/VF/PEA

Begin resuscitation

Consider Field Termination (obtain On-line Medical Direction REQUIRED) if patient meets inclusion criteria and remains in pulseless after:
- 3 doses of ACLS drugs
- Fluid challenge if PEA/Asystole
- Associated shocks if in VF/VT

- Courtesy notification to receiving facility, if transporting

Signs of Irreversible Death

- Decapitation
- Decomposition
- Dependent lividity
- Rigor mortis
- Pulseless and apneic with extrusion of brain matter
- Pulseless and apneic with removal of the lower half of the body
- Pulseless and apneic with full thickness burns over 90% total body surface area

Updated May 7, 2012
Universal Toxicological Response

Determine Product or Agent Involved.
If unknown, determine symptoms of those exposed.
Provide for safety of responding providers, patients, and bystanders

- Document findings and contact Poison Control.
- Document recommendations from Poison Control

- Contact Medical Control as soon as possible.
- Advise of Poison Control’s Recommendations and treatment rendered.
- Document Medical Direction’s Orders.
- Recommend dispatch of additional Tox Medic resources to Command, if necessary.

As new information is obtained, update:
- Poison Control
- Medical Direction
- Receiving Hospitals

Poison Control
602-253-3334
(Refer to Toxicology Report)

Refer to specific Guidelines for exposures to:
- Methemoglobinemia
- CO Poisoning
- Cyanide Poisoning
- Sulfide Poisoning
- Organophosphate / N-Methylcarbamate Poisoning (Insecticide-Nerve Agent)
- Eye Contamination

Product Concentration
Types of Exposure
Length of Exposure
Initial Signs and Symptoms
Present Signs and Symptoms
Assure Scene Safety
Perform appropriate decontamination if able. Confirm exposure, amount, and duration.

- Maintain Airway, Breathing, Circulation.
- Establish vascular access (Do not delay Decontamination for vascular access)

Begin eye decontamination immediately
After initial 5 minutes of irrigation or if patient can not open eyes for irrigation then give:
Proparacaine Eye Drops: 1-2 drops in affected eye(s)
Wait 30-60 seconds for anesthetic effect.

Consider the use of Morgan Lens to facilitate decontamination

Continue irrigation until directed to stop by Medical Direction

Contact Poison for further recommendation. Contact Medical Direction

Poison Control
602-253-3334

Notes
- Irrigate with copious amounts of LR, NS, or water. (LR is preferred with the Morgan Lens.)
- Do not use neutralizing agents.
- Transport for evaluation.
- Refer to Pain Management off-line to treat pain.
- Use of Proparacaine and/or Morgan Lens for substances other than hazardous materials requires on-line medical control. Ex. Soot, dust, corneal scratches, or abrasions.
Cyanide Poisoning Option 1
Cyano-Kit, optional agent
Special Training Required

Assure Scene Safety
Perform appropriate decontamination if able. Confirm exposure, amount, and duration.

- Maintain Airway, Breathing, Circulation.
- Administer High Flow O2.
- Treat dysrhythmias (common with cyanide toxicity).
- Establish vascular access.

Establish dedicated large bore IV with tubing provided in Cyano-kit (Regular IV tubing will not work for Cyano-kit administration)

Administer Hydroxocobalamin (Cyano-kit)

Adult: 5g IV over 15 min
(both 2.5g vials-7.5 min / vial or 15mL / min)
Second Dose: 5g for a total of 10g over 15 min – 2 HRS titrated to patient condition

Contact Poison Control for further recommendation
Contact Medical Direction

Poison Control
602-253-3334

Signs and Symptoms
- Abrupt onset of profound effects
- Headache / Altered LOC
- Loss of Consciousness
- Nausea
- Dyspnea / Agonal Respirations
- Seizures
- Cardiovascular Collapse
- Hypotension
- Cardiac Arrhythmias

Notes
- Reconstitute each vial with 100mL of NS. •Use LR or D5W if NS not available.
- Chemical Asphyxiant
- Almost never smells like almonds
- Sources: Products of combustion/smoke inhalation and fumigants
- Same IV Line Incompatibilities
  - Diazepam
  - Dopamine
  - NTG
  - Dobutamine
  - Propofol
  - Pentobarbitol
  - Sodium Nitrite
  - Sodium Thiosulfate
Carbon Monoxide Poisoning

Measure SpCO
SpCO should be measured in firefighters during rehab, smoke inhalation patients, occupants of building with CO detectors alarm activation, or patients with symptoms suggestive of CO poisoning

SpCO 0-3%
No further medical evaluation of SpCO needed

SpCO >3%
Loss of consciousness or neurological impairment or SpCO >25% or pregnant with SpCO >15%

SpCO < 12%
Symptoms of CO exposure? *
No
No further medical evaluation of SpCO needed. Determine source of CO if nonsmoker.

SpCO > 12%
Transport on 100% oxygen for ED evaluation.

SpCO >12%
Transport on 100% oxygen for ED evaluation.

Notes
- Smokers can have normal SpCO levels up to 10%
- Potential long term effects in patients, particularly children, elderly and pregnant patients with exposure
- This is a high risk refusal. Providers should contact Poison Control at 602-253-3334 for medical advice, then obtain On-line Medical Direction to Medical Control for Medical Direction
- Consider transport to facility with a hyperbaric chamber
  - Scottsdale Osborn
  - St Joes

Cyanide Poisoning Option 2

Assure Scene Safety
Perform appropriate decontamination if able.
Confirm exposure, amount, and duration.

Maintain Airway, Breathing, Circulation.
Establish vascular access

Administer Sodium Nitrite
Adult: 300mg IV over 5-10 minutes
(Can give faster during cardiac arrest)
Pediatric: 0.33 ml/kg of 3% solution over 5-10 minutes.
May repeat if no response in 15 to 30 minutes.

Administer Sodium Thiosulfate (25%)
Adult: 12.5g (50ml of 25%) IV over 5 minutes.
(Can be faster during codes)
Pediatric: 1.65ml/kg of 25% solution over 5 minutes.

Contact Poison for further recommendation.
Contact Medical Direction

Poison Control
602-253-3334

Signs and Symptoms
- Abrupt onset of profound effects
- Headache / Altered LOC
- Loss of Consciousness
- Nausea
- Dyspnea / Agonal Respirations
- Seizures
- Cardiovascular Collapse
- Hypotension
- Cardiac Arrhythmias

Notes
- Chemical Asphyxiant
- Almost never smells like almonds
- Sources:
  - Apricot Pits
  - Combustion of plastics, synthetics, or wool
- If smoke inhalation or suspected carbon monoxide poisoning present, then do not give Nitrites unless carboxyhemoglobin fraction is known to be less than 10%
Methemoglobinemia

Assure Scene Safety
Perform appropriate decontamination if able.
Confirm exposure, amount, and duration.

- Maintain Airway, Breathing, Circulation.
- Establish vascular access (Do not delay Decontamination for vascular access)

Administer **Methylene Blue:**
Mix in 100cc bag of NS
Dose: 2mg/kg IV over 5-10 minutes
May repeat at: 1mg/kg if no change within 10-20 minutes

Note:
Do not use when known G-6-PD deficiency

Contact Poison for further recommendation. Contact Medical Direction

Poison Control
602-253-3334

**Signs and Symptoms**
- Headache/Dizziness
- Altered LOC
- Nausea
- Dyspnea
- Seizures
- Coma
- Generalized Skin Discoloration
  "Chocolate Cyanosis"
- Chocolate Brown Blood

**Notes**
- Causative Agents
  Local Anesthetics
  Analgesics
  Anti-microbials
  Nitrites/Nitrates
  Amyl Nitrite/Butyl Nitrite
  Aniline Dyes
  Chlorates
  Nitrobenzenes
  Aminophenol
- May occur with the use of Amyl Nitrite for Cyanide and Sulfide poisonings
Organophosphate/ N-Methylcarbamate/ Nerve Agent Exposure

Assure Scene Safety
Perform appropriate decontamination if able.
Confirm exposure, amount, and duration.

• Maintain Airway, Breathing, Circulation.
• Establish vascular access

Administer Atropine Sulfate
Adult Dose: 2-5 mg IV every 2-5 minutes
Ped Dose: 0.05 mg/kg IV every 2-5 minutes

Continue to repeat dosing until atropinization:
• No wheezing
• No bronchorrhea
• No diaphoresis
• No bradycardia
• No diarrhea
• No vomiting

Administer Pralidoxime Chloride (2 PAM)
Reconstitute with 20cc of sterile water
Adult dose: 1-2 grams IV over 10-15 minutes
Peds dose: 30-50mg/kg over 10-15 minutes

Note: Sudden onset apnea may occur in infants, usually after the second dose.

Consider 2-PAM drip for severe cases after initial dose.

Contact Poison for further recommendation.
Contact Medical Direction

Poison Control
602-253-3334

Signs and Symptoms
• SLUDGE Syndrome
• Fasciculations / Seizures
• Loss of Consciousness
• Dyspnea / Apnea

Notes
• Exposure- Vapor or absorbed
• Will penetrate clothing
• Mark 1 Kit appropriate for mass casualty situation
• Causative Agents
  Local Anesthetics
  Analgesics
  Anti-microbials
  Nitrates/Nitrites
  Amyl Nitrite/Butyl Nitrite
  Aniline Dyes
  Chlorates
  Nitrobenzenes
  Aminophenol
• May occur with the use of Amyl Nitrite for Cyanide and Sulfide poisonings
• If the patient begins to Seize, please refer to the Seizure off-line.
Sulfide Poisoning

Assure Scene Safety
Perform appropriate decontamination if able.
Confirm exposure, amount, and duration.

- Maintain Airway, Breathing, Circulation.
- Establish vascular access

Administer Sodium Nitrite
Adult: 300mg IV over 5-10 minutes (Can give faster during cardiac arrest)
Pediatric: 0.33 ml/kg of 3% solution IV over 5-10 minutes.
May repeat if no response in 15 to 30 minutes.

Contact Poison for further recommendation.
Contact Medical Direction

Poison Control
602-253-3334

Signs and Symptoms
- May report “rotten egg” odor
- Upper airway irritation
- Non-Cardiogenic Pulmonary Edema (late onset)
- Rapid collapse

Notes
- Cellular Asphyxiant
- Rapid olfactory overload- may not report rotten egg odor
- Sources:
  - Decaying organic matter
  - Petroleum refining
  - Mining
  - Pulp/Paper factories
  - Sewage
  - Hot Asphalt fumes
  - Septic systems

- “Rotten egg” odor may be present with as little as 0.025 PPM
EZ IO / or equivalent
Adult and Pediatric

Indications:
- Immediate vascular access in emergencies.
- Intravenous fluids or medications are urgently needed and a peripheral IV cannot be established in 2 attempts or 90 seconds AND the patient exhibits one or more of the following:
  - An altered mental status (GCS of 8 or less)
  - Respiratory compromise (SaO2 <90% after appropriate oxygen therapy, respiratory rate <10 or >40 min)
  - Hemodynamic instability

Contraindications:
- Fracture of the bone selected for IO infusion (consider alternate site)
- Excessive tissue at insertion site with the absence of anatomical landmarks (relative contraindication)
- Previous significant orthopedic procedures (IO within 24 hours, prosthesis)
- Infection at the site selected for insertion

Procedure:
1. If the patient is conscious, advise of EMERGENT NEED for this procedure and obtain informed consent.
2. Wear approved BSI equipment
3. Determine indications and rule out contraindications
4. Locate appropriate insertion site
5. Prepare insertion site using aseptic technique.
6. Prepare the EZ-IO driver and appropriate needle set
7. Stabilize site and insert appropriate needle set.
8. Remove EZ-IO® driver from needle set while stabilizing catheter hub.
9. Remove stylet from catheter and place stylet in shuttle or approved sharps container.
10. Confirm placement and patency.
11. Connect primed EZ-Connect®.
12. Slowly administer Lidocaine 2% (Preservative Free) IO to conscious patients (after ensuring patient has no allergy or sensitivity to Lidocaine.)
   - Adults: 20-40mg; Peds: 0.5mg/kg to a max of 20 mg
13. Rapid syringe bolus (flush) the EZ-IO PD® with 10 ml of normal saline (5 ml for pediatric).
14. Utilize pressure bags for continuous infusion
15. Dress site, secure tubing, and apply wristband as directed.
16. Monitor EZ-IO® site and patient condition

Notes:
1. EZ-IO AD (adult) to be used for patients 40 Kg. and over. EZ-IO PD (pediatric) to be used for patients 3-39 Kg.
2. Due to the anatomy of the IO space, flow rates may appear to be slower than those achieved with an IV catheter.
3. Insertion of the EZ-IO in conscious patients has been noted to cause mild to moderate discomfort, however, IO infusion in conscious patients has been noted to cause severe discomfort.
4. EZ-IO catheter should be removed within 24 hours
Rapid Sequence Intubation (RSI)
Adult (≥ 15 y/o)

Pre-oxygenate the patient for 4-5 minutes with 100% oxygen

Apply and maintain cricoid pressure until tube placement is confirmed

Sedate the patient
Etomidate (Amidate) 0.3 mg/kg IV over 30-60 seconds
Or Ketamine 1.5 mg/kg IV over 30-60 seconds. Max 150 mg

Paralyze the patient
Succinylcholine (Anectine) 1.5 mg/kg

Intubate and confirm tube placement (End-tidal CO2 detector required)
In-line capnography recommended. Reading should be maintained between 35-45.

Yes ← Successful? → No

Post-intubation Sedation.
Refer to Sedation Off-line, as needed.

Pain Management
Refer to Pain Management Off-line, as needed.

Place NG/OG tube if indicated

Indications for RSI
- Respiratory failure
- Loss of gag or protective airway reflexes
- GCS < 8
- Severe head trauma
- Spinal cord injuries
- Facial and/or airway burns
- Asthma or respiratory illnesses

Contraindications for RSI
- Cardiac Arrest is a contraindication for RSI
- History of malignant hyperthermia
- Known or suspected renal failure

1. Sedation with Etomidate (Amidate) should occur in 30-50 seconds
2. Paralysis with Succinylcholine (Anectine) should occur in <1 min
3. If unable to ventilate adequately, assess need for rescue airway device.
4. If unable to ventilate patient with BVM or rescue airway device, perform surgical cricothyrotomy.

Courtesy notification to receiving facility

Updated Nov. 9, 2016
**CPAP**

**Adult (≥ 15 y/o)**

### Procedure:

1. Explain the procedure to the patient
2. Ensure adequate oxygen supply to the ventilation device
3. Monitor pulse oximetry, ETCO2 (if available), and ECG continuously
4. Place patient in seated position with head of bed >45 degrees
5. Connect CPAP device to suitable oxygen supply
   1. Attach breathing circuit to CPAP device and ensure device is functioning properly
   2. Apply and secure appropriate size breathing circuit mask to patient
   3. Set CPAP at 5 cm H2O and titrate positive airway pressure until improvement in patient pulse oximetry and symptoms.
   
   **WARNING:** Do not exceed pressures of 10 cm H2O.

6. Refer to Respiratory Distress Off-line, as needed
7. Refer to Sedation Off-line, as needed.
8. Contact Medical Control.

### Indications for CPAP:

Severe respiratory distress due to suspected pulmonary edema, pneumonia, or COPD exacerbation (bronchitis, emphysema).

### Contraindications:

1. Age <14
2. Patient is in respiratory arrest or unable to maintain own airway
3. Facial trauma preventing an adequate face to mask seal
4. Tracheotomy
5. Suspected pneumothorax
6. Active upper GI bleed or recent gastric surgery (2 weeks).

### Relative Contraindications

1. Altered mental status, inability to follow commands
2. Systolic BP <100 mmHg
3. Excessive secretions
4. Nausea or vomiting

### Special Notes:

1. CPAP therapy needs to be continuous and should not be removed unless the patient cannot tolerate the mask, experiences respiratory arrest, or begins to vomit.
2. Intermittent positive pressure ventilation with a BVM, placement of an OPA/NPA and/or intubation should be considered if the patient is removed from CPAP
3. Advise receiving ED of CPAP use ASAP so they can arrange for respiratory therapy
4. CPAP is only to be removed in the ED when the RT is present and ready to transfer the patient to their equipment, or at the discretion of the receiving physician who is present.
5. Watch patient for gastric distention
6. CPAP may be performed on a patient with a DNR
7. Due to changes in preload and afterload of the heart during CPAP therapy, a complete set of vital signs must be obtained every 5 minutes.
Ventricular Assist Devices: Adult & Pediatric

Use this guideline for:

1. Patients that have had an implantable ventricular assist device (VAD), including a left ventricular assist device (LVAD), right ventricular assist device (RVAD), or biventricular assist device (BiVAD), and have symptoms of cardiovascular compromise.
2. Patients with VADs that are in cardiac arrest.
3. Patients with VADs that are experiencing a medical or injury-related event not involving the cardiovascular system or VAD malfunction.

EMS role is to:

- Contact patient’s VAD program on-call coordinator, using the phone number on the device.
- Rapidly identify cardiovascular compromise in patients with VAD and provide interventions.
- Rapidly identify VAD-related malfunctions or complications (including stroke, infection) and provide interventions.
- Manage airway as indicated.
- Contact the patient’s VAD program on-call coordinator, using the phone number on the device; follow coordinator’s advice.
- If patient is in full cardiac arrest, CPR should not be performed if there is evidence that the pump is still functioning.
- Decision to perform CPR should be made in consultation with patient’s VAD-trained companion and VAD coordinator. CPR may be initiated only where:
  - Confirmation that the pump has stopped and troubleshooting efforts have failed, and
  - Patient is unresponsive and has no detectable signs of life.

Assess for possible pump malfunction:

- Assess for alarms.
- Auscultate for pump sound “hum”.
- Signs of hypoperfusion including pallor, diaphoresis, altered mental status (blood pressure reading is unreliable).

If the VAD pump has malfunctioned:

- Contact the patient’s VAD-trained companion, if available.
- Check all the connections to system controller.
- Change VAD batteries, and/or change system controller if indicated.
- Have patient stop all activity and assess for patient tolerance.
- Follow appropriate cardiovascular condition-specific protocol(s) as indicated.

If patient is experiencing VAD-related complications or cardiovascular problems, expedite means of transport that will get patient to his/her VAD program if patient’s clinical condition and time allows, otherwise to the nearest VAD-trained facility.

If patient has a functioning VAD and is experiencing a non-cardiovascular-related problem, transport to a facility that is appropriate for the patient’s main presenting problem without manipulating the device.

AEMT

- Establish PIV.
- If patient has a functioning VAD and is hypoperfusing (pale, diaphoretic, delayed capillary refill, altered mental status), administer IV fluids: 30 mL/kg, maximum 1 L, over <15 minutes, using push-pull method.
- May repeat up to 3 times based on patient’s condition and clinical impression.
- Avoid nitroglycerin.

EMT-I/Paramedic

- Cardiac monitoring. Acquire 12-lead EKG. Patient’s baseline may be arrhythmia; obtain VAD coordinator’s advice prior to administering antiarrhythmics.
If 12 lead capability is available, EMS performs a 12 lead EKG in the field and makes a STEMI diagnosis.

Is the crew able to transmit the 12 lead to the receiving facility?

Yes

EMS transmits the EKG to the receiving facility and interprets the 12 lead for the receiving facility

No

EMS calls receiving facility obtain On-line Medical Direction Line and interprets the 12 lead EKG for the receiving facility

Courtesy notification to closest appropriate facility

When calling the receiving facility the Universal Terminology to be used is:

This is a “Cardiac / STEMI alert”

Additional Information may be given if needed. This includes:

Patient’s Legal Name
Patient’s Date of Birth
Patient’s Cardiologist
Estimated Time of Arrival
CARDIOCEREBRAL RESUSCITATION (CCR)
(aka Minimally Interrupted Cardiac Resuscitation)

- EMD pre-arrival COCPR instructions
  - Bystander COCPR

  EMS ARRIVAL

  Chest Compressions:
  - 100/min
  - at least 2” in depth
  - full chest recoil

  200 chest compressions

  200 chest compressions

  200 chest compressions

  200 chest compressions

  Analysis

  Single shock if indicated without pulse check or rhythm analysis
  Single shock if indicated without pulse check or rhythm analysis
  Single shock if indicated without pulse check or rhythm analysis

  Transport to closest CRC if possible

  Administer 1 mg IV/IO Epinephrine

  - Resume standard ACLS (30:2)
  - Consider ETI (Do NOT Interrupt Compressions)

*If adequate uninterrupted bystander chest compressions are provided, EMS providers perform immediate rhythm analysis

COCPR = compression-only CPR  CRC = cardiac receiving center  EMD = emergency medical medical dispatch
Cardiocerebral Resuscitation (CCR)

Adult (>8y/o)

**Notes:**
1. *Recommended defibrillation dose varies by device used. For biphasic defibrillator follow manufacturer's recommendation.*
2. Perform chest compressions at a rate of at least 100/minute.
3. If a potentially perfusing rhythm returns, finish current round of 200 compressions prior to pulse check.
4. If a return of spontaneous pulse occurs, proceed with supportive care.
5. Do not attempt ventilation/intubation until after the fourth set of 200 compressions.

**Contraindications:**
- Children < 8 years old
- Known/suspected overdose
- Respiratory cause of arrest
- Known/suspected hypothermia
- Near Drowning
- Traumatic arrest
- Burned beyond recognition.

**Documentation:**
- Was bystander CPR in progress?
- If bystander CPR, who was performing CPR; i.e., family, friends, law enforcement, etc.
- Estimated time of collapse.
- AED use prior to arrival?
- Was patient gasping prior to arrival?
- Specify that CCR protocol was utilized.
- Time and dosages of all defibrillations and medications.
- All monitored cardiac rhythms.
Inclusion Criteria:
1. Non-traumatic OHCA with return of palpable central pulses or other evidence of spontaneous circulation
2. GCS less than 8 after ROSC
3. Transport to CAC when feasible, resources available, and will add less than 15 minutes to transport time compared to transport to non-CAC
4. Less than 30 minutes CPR prior to arrival of EMS
5. Female patients not pregnant
6. No uncontrolled hemorrhage
7. No persistent unstable arrhythmia
8. Patient does not appear to have severe environmental hypothermia related arrhythmia
9. No DNR paperwork identified during resuscitation

Post resuscitation care

1. Control airway as necessary
2. Maintain PCO2 between the range of 35-45. SPO2 of >95% should be maintained. Maintain ventilation rate of 8-10 breaths per minute, adjust as needed to ensure proper oxygenation.
3. Consider anti-arrhythmic medication
4. If available administer 2000 mL cold (4°C/39.2°F) NS IV fluid bolus to the adult patient
5. Apply cold/ice packs to groin/axillae/neck
6. Consider dopamine for persistent hypotension
7. Perform 12-lead ECG to check for STEMI (ST elevation MI) and pre-notify ED
8. Do not warm patient
# Blood Thinners

How to Use the FLACC

In patients who are awake: observe for 1 to 5 minutes or longer. Observe legs and body uncovered. Reposition patient or observe activity. Assess body for tenseness and tone. Initiate consoling interventions if needed.

In patients who are asleep: observe for 5 minutes or longer. Observe body and legs uncovered. If possible, reposition the patient. Touch the body and assess for tenseness and tone.
AZ Drug Profiles

These drug profiles were developed by the Department, in cooperation with its advisory committees, to provide guidelines for the safe and effective use of agents for maximum patient benefit. These drug profiles are intended to be used as reference documents by medical control authorities, EMS educators, and EMS providers. A list of specific drugs is provided below, along with the Agency Guidance Documents that reflect the most current drug profiles.

Drug Profiles main link: http://www.azdhs.gov/preparedness/emergency-medical-services-trauma-system/index.php#drug-profiles

## Activated Charcoal

**Indications**
Poisoning/Overdose, should only be given within the first hour of ingestion

**Contraindications**
Do not give before or together with Ipecac, protect airway

**Side Effects**
None for the field

**Dosage, route**
- **Adult**: 30-60 Gm (1-2 Gm/kg); if not in pre-mixed slurry, mix one part charcoal with four parts water.
- **Pediatric**: 0.5 -1.0 Gm/kg; if not in pre-mixed slurry, mix one part charcoal with four parts water.

## Adenosine

**Indications**
PSVT

**Contraindications**
Do not give if second or third degree heart block or sick sinus syndrome, or known WPW

**Side Effects**
Transient dysrhythmias, facial flushing, dyspnea, chest pressure, hypotension, headache, nausea, bronchospasm

**Dosage, route**
- **Adult**: 6mg IV rapidly over 1-3 sec with a 20ml N/S flush. If no effect after 1-2 minutes give 12mg IV rapidly with a 20ml N/S flush. May repeat 12mg dose in 1-2 min.
- **Pediatric**: 0.1mg/kg IV rapidly with a 2-3ml N/S flush. If no effect after 2 min give 0.2mg/kg rapidly with a 2-3ml N/S flush. May repeat 0.2mg/kg dose in 1-2 minutes. Max dose should not exceed 12mg.

## Albuterol

**Indications**
Treatment of brochospasm

**Contraindications**
Do not use with MAO inhibitors, cyclics, or when tachycardia or hypertension is present

**Side Effects**
Muscle tremors, tachycardia, heartburn, nausea/vomiting

**Dosage, route**
- **Adult**: 2.5mg/3ml NS via SVN or inline. (Use 0.083% solution) May mix with atrovent up to 3 times, if needed
- **Pediatric**: 2.5mg/3ml NS via SVN or inline. (Use 0.083% solution) May mix with atrovent up to 3 times, if needed

## Amiodarone

**Indications**
Treatment of: shock-refractory VF/pulseless VT, polymorphic VT, and wide complex tachycardia of uncertain origin. Control hemodynamically stable ventricular tachycardia when cardioversion unsuccessful. Adjunct to cardioversion of SVT and PSVT. Rate control in atrial fibrillation or flutter.

**Contraindications**
Bradyarrhythmias, second or third degree heart block. Cardiogenic shock. Hypotension. Pulmonary congestion

**Side Effects**

**Dosage, route**
- **Adult V-Fib/Pulseless V-Tach**: 300mg IV Push. May repeat once in 3-5 minutes with 150mg IV push.
- **Adult wide complex tachycardias, A-flutter, A-fib, SVT with cardioversion**: 150mg IV over 10 minutes. May repeat every 10 minutes.
- **Pediatric V-fib/Pulseless V-tach**: 5mg/kg IV push (max 300 mg dose). May repeat every 5 minutes two times to a total max dose of 15mg/kg/day.
- **Pediatric probable V-tach with a pulse**: 5mg/kg IV push over 20 minutes. May repeat every 5 minutes two times to a total max dose of 15mg/kg/day.
### Aspirin (Chewable)

**Indication**  
Chest pain of cardiac origin

**Contraindications**  
Known allergy, bleeding disorders such as hemophilia

**Side Effects**  
None for the field

**Dosage, route**  
**Adult:** 2-4 chewable 81 mg tablets PO chew and swallow  
**Pediatric:** None

### Atropine Sulfate

**Indication**  
Sinus bradycardia, AV Blocks

**Contraindications**  
A-fib or flutter with rapid ventricular response, myocardial infarction, glaucoma

**Side Effects**  
Blurred vision, dry mouth, flushing, urinary retention, headache, dilated pupils

**Dosage, route**  
**Adult IV:** 0.5 mg rapid IVP q 3-5 minutes. **MAX Dose** 3mg  
**Pediatric IV:** .02 mg/kg. **Min dose** 0.1 mg. **Max. single dose** 0.5 mg. May repeat x1 in 5 minutes.  
Maximum single doses: 0.5 mg

### Atrovent

**Indication**  
Treatment of brochospasm

**Contraindications**  
It should not be used in patients with hypersensitivity to Atrovent or Atropine

**Side Effects**  
Coughing, sputum increase, dizziness, insomnia, tremor, nervousness, nausea

**Dosage, route**  
**Adult and Pediatric dose:** 500 mcg in 2.5 NS (single bullet) SVN. May be mixed with Albuterol to a max of 3 times

### Calcium Chloride

**Indications**  
Acute hypocalcaemia, calcium channel blocker and magnesium overdoses, acute hyperkalemia

**Contraindications**  
Incompatible with all drugs, flush the line before and after administration. Use cautiously on digitalis pts

**Side Effects**  
Brady-asystolic arrest, sever tissue necrosis if extravastates, serious arrhythmias in digitalis patients

**Dosage, route**  
**Adult:** IV bolus 5-10 ml of a 10% solution. May repeat in 10 minutes. **Pre-treatment for IV Verapamil:** 3ml of 10%, may repeat once.  
**Pediatric:** IV bolus 0.2-0.25 ml/kg of a 10% solution infused slowly. Should not be repeated.

### Dextrose 50% (D-50)

**Indications**  
Adult hypoglycemia, unconscious diabetic, coma, or seizure of unknown etiology.

**Contraindications**  
Pediatrics: use D25 or D10; head injury pts; incompatible with NaHCO₃, diazepam will precipitate if not flushed

**Side Effects**  
Tissue necrosis if infiltrated

**Dosage, route**  
**Adult:** 25-50cc of 50% solution IV push, may repeat one time.  
**Pediatric:** See D-25 and D-10.

### Dextrose 25% (D-25) and Dextrose 10% (D-10)

See Next Page
### Dextrose 25% (D-25) and Dextrose 10% (D-10)

<td>Hypotension, temporary pulsating headache, flushing</td>
</tr>
</tbody>
</table>
| Dosage, route    | **Adult:** 0.4 mg (either by tablet or spray) SL. May repeat q 5 minutes for a total of 3 doses.  
**Pediatric:** none |
# Ondansetron

<table>
<thead>
<tr>
<th>Indications</th>
<th>Nausea, vomiting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contraindications</td>
<td>Hypersensitivity. Use with caution in patients with hepatic impairment</td>
</tr>
</tbody>
</table>
| Side Effects | CNS: Headache, malaise, fatigue, dizziness, fever, sedation, extrapyramidal syndrome  
Cardiovascular: Chest pain, arrhythmias.  
Respiratory: Hypoxia.  
GI & Hepatic: Diarrhea, constipation, abdominal pain, xerostomia, decreased appetite.  
Skin: Rash |
| Dosage, route | Adult: 4–8 mg IV slow push over 2–5 minutes. Or 8 mg PO ODT or tablet  
>40 kg: 4 mg slow over 2-5 minutes.  
4-12 years old: 4 mg PO or ODT  
May be given IM if no IV access |

---

# Sodium Bicarbonate

<table>
<thead>
<tr>
<th>Indications</th>
<th>Metabolic acidosis, cardiac arrest with a down time &gt;10 minutes, tricyclic antidepressant overdose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contraindications</td>
<td>Low serum potassium, patient unable to tolerate salt load (i.e., CHF)</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Alkalosis, precipitates when mixed with calcium chloride</td>
</tr>
</tbody>
</table>
| Dosage, route | Adult: 1 mEq/kg IV initially then 0.5 mEq/kg every 10 minutes  
Pediatric: 1 mEq/kg IV or IO slowly. Neonate dose 1 mEq/kg IV or IO of 4.2% solution |

---

# Succinylcholine (Anectine)

<table>
<thead>
<tr>
<th>Indication</th>
<th>Endotracheal intubation requiring paralysis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contraindications</td>
<td>Muscle disorders and personal or family history of malignant hyperthermia</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Vagal stimulation leading to bradycardia or asystole. Will cause muscle paralysis</td>
</tr>
</tbody>
</table>
| Dosage, route | Adult: 1.5 mg/kg IVP.  
Pediatric: None |

---

# Thiamine

<table>
<thead>
<tr>
<th>Indications</th>
<th>Coma of unknown origin, use prior to D50 administration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contraindications</td>
<td>Hypotension</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Restlessness, nausea, diarrhea, anaphylactic reaction, pulmonary edema</td>
</tr>
</tbody>
</table>
| Dosage, route | Adult: 100 mg slow IV or IM  
Pediatric: none |
### Toxicology Paramedic Drug Profiles

#### Atropine

**Description**
Atropine affects the muscarinic receptors of the autonomic nervous system by inhibiting their effects. At higher doses it also has a similar effect on the nicotinic receptors.

**Indications**
Treatment of organophosphate and carbamate poisoning.

**Contraindications**
There are no contraindications to administration of atropine. Note: Tachycardia is not a contraindication.

**Side Effects**
Dry mouth, decreased bronchial secretions, mydriasis, flushing, tachycardia, urinary retention, ileus, confusion, ataxia, hallucinations, psychosis, seizures.

**Dosage, route**
- **Adult:** 2 – 5 mg IV push q 5 – 10 minutes until atropinization.
- **Pediatric:** 0.05 mg / kg IV push q 5 – 10 minutes until atropinization. Continue dosing until: no wheezing, no bradycardia, no diarrhea, no brochorrhea, no diaphoresis.

**Amount carried**
16 - 8mg / 20ml vials (0.4 mg / ml)

#### Hydroxocobalamin

**Description**
Used in the treatment of acute cyanide poisoning. Detoxifies cyanide by forming cyanocobalamin which is excreted in the urine.

**Indications**
Treatment of suspected or known cyanide poisoning.

**Contraindications**
None

**Side Effects**
Rash, chest tightness, edema, urticaria, pruritus, dyspnea, and rash. Most common adverse reactions (>5%) are transient and include chromaturia (red-colored urine), erythema (skin redness), rash, increased blood pressure, nausea, headache, decreased lymphocyte percent, and injection site reactions.

**Dosage, route**
2.5 grams in a vial. Add 100cc N/S. Mix by rocking or rotating vial. Do not shake. Infuse. Repeat with second vial.

**Amount carried**
2.5 grams in a vial. Add 100cc N/S. Mix by rocking or rotating vial. Do not shake. Infuse. Repeat with second vial.
## Toxicology Paramedic Drug Profiles

### Methylene Blue

<table>
<thead>
<tr>
<th>Description</th>
<th>Dark blue crystalline powder in solution with water or alcohol. Used in in the treatment of methemoglobin toxicity. Acts as reducing agent to convert iron in methemoglobin from Fe+++ to Fe++, regenerating normal hemoglobin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications</td>
<td>Treatment of severe symptomatic methemoglobinemia.</td>
</tr>
<tr>
<td>Contraindications</td>
<td>Known Glucose-6-phosphate dehydrogenase deficiency.</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Nausea, vomiting, abdominal and chest pain, headache, dizziness, confusion, dyspnea, hypertension.</td>
</tr>
<tr>
<td>Dosage, route</td>
<td>7ml (0.1ml/kg of 1% soln) IV over 2-3 minutes with NaCl running at 200-300ml/hr. May repeat in 10 minutes if not improved. Mix in 100cc bag N.S 2.0 mg / kg IV over 5 – 10 minutes, May repeat at 1.0 mg / kg if no change within 10 – 20 minutes.</td>
</tr>
<tr>
<td>Amount carried</td>
<td>8 - 100mg / 10ml vials.</td>
</tr>
</tbody>
</table>

### Proparacaine (Opthetic)

<table>
<thead>
<tr>
<th>Description</th>
<th>Proparacaine is a topical ocular local anesthetic of the ester class producing anesthesia lasting approximately 15 minutes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications</td>
<td>Topical anesthesia of the eye when preparing to insert Morgan Lens for Irrigation.</td>
</tr>
<tr>
<td>Contraindications</td>
<td>Contraindicated in known hypersensitivity to the drug or benzalkonium chloride (preservative).</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Temporary burning, redness, stinging of conjunctiva may occur.</td>
</tr>
<tr>
<td>Dosage, route</td>
<td><strong>Adult and Pediatric:</strong> 1-2 gtt into affected eye. May repeat q 5–10 minutes</td>
</tr>
<tr>
<td>Amount carried</td>
<td>4 Eye drop bottles (0.5%) <strong>Keep cool.</strong></td>
</tr>
</tbody>
</table>

### Protopam Chloride (Pralidoxime Chloride, 2-Pam)

<table>
<thead>
<tr>
<th>Description</th>
<th>Protopam is an odorless white powder used to reactivate Cholinesterase enzymes, which have been inactivated by phosphorylation by organophosphates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications</td>
<td>Treatment of organophosphate poisoning.</td>
</tr>
<tr>
<td>Contraindications</td>
<td>No absolute contraindications. Known hypersensitivity to drug is a relative contraindication to administration.</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Local pain, blurred vision, dizziness, headache, nausea, tachycardia, increased BP, hyperventilation.</td>
</tr>
<tr>
<td>Dosage, route</td>
<td>2gms diluted in 20cc sterile water per gram. <strong>Adults:</strong> 1 – 2 gms IV over 10 – 15 minutes. <strong>Pediatric:</strong> 30 –50 mg /kg over 10 – 15 minutes.</td>
</tr>
<tr>
<td>Amount carried</td>
<td>12 - 1 gram powered vials.</td>
</tr>
</tbody>
</table>
### Sodium Nitrite

<table>
<thead>
<tr>
<th>Description</th>
<th>White or slightly yellow powder soluble in water. When used in cyanide poisoning acts with hemoglobin to form methemoglobin. The methemoglobin then forms complexes with the cyanide inactivating it. In hydrogen sulfide poisoning reacts with hemoglobin to form sulfmethemoglobin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications</td>
<td>Indicated in the treatment of severe symptomatic cyanide and hydrogen sulfide poisoning.</td>
</tr>
<tr>
<td>Contraindications</td>
<td>None</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Nausea, vomiting, abdominal pain, dizziness, headache, flushing, cyanosis, tachypnea, vasodilatation, syncope, hypotension, tachycardia.</td>
</tr>
<tr>
<td>Dosage, route</td>
<td>Administer 300mg of Na Nitrite (10ml of 3% solution) IV over 5 -10 minutes. If symptoms not improved in 15 to 30 minutes may repeat dose. <strong>Adults:</strong> 10 ml (300 mg; 1 amp) IV over 5 – 10 minutes. Can be give faster during cardiac arrest. <strong>Pediatric:</strong> 0.33 ml / kg of 3% solution IV over similar time period.</td>
</tr>
<tr>
<td>Amount carried</td>
<td>8 – 300mg / 10ml Ampules</td>
</tr>
</tbody>
</table>

### Sodium Thiosulfate

<table>
<thead>
<tr>
<th>Description</th>
<th>Used in the treatment of cyanide poisoning. Reacts with cyanide-methemoglobin complex to form stable thiocyanate, which is then excreted by kidneys.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indications</td>
<td>Treatment of severe symptomatic cyanide poisoning.</td>
</tr>
<tr>
<td>Contraindications</td>
<td>Don’t give for Sulfide poisoning</td>
</tr>
<tr>
<td>Side Effects</td>
<td>Relatively nontoxic.</td>
</tr>
<tr>
<td>Dosage, route</td>
<td>12.5gm (50ml of 25% solution) IV over 5 minutes. <strong>Adults:</strong> 50ml (12.5 gms) IV over 5 minutes. Give fast during cardiac arrest. <strong>Pediatric:</strong> 1.65 ml / kg of 25% solution IV over similar time period.</td>
</tr>
<tr>
<td>Amount carried</td>
<td>8 - 12.5 gms in 50 ml (250 mg / ml)</td>
</tr>
</tbody>
</table>
## Approved Substitutes

### Dexamethasone (Decadron) -- substitute for Solu-Medrol

- **Indications**: Reactive Airway Disease, Anaphylaxis
- **Contraindications**: Preterm infants, Systemic fungal infections
- **Side Effects**: None from a single dose
- **Dosage, route**:
  - **Adult**: 8-24 mg slow IV bolus or IM. (20mg approx. equal to 125mg Solu-Medrol)
  - **Pediatric**: 0.25-0.5 mg/kg

### Nalmefene HCl (Revex) -- substitute for Narcan

- **Indication**: Opiate overdose, Coma of unknown origin
- **Contraindications**: Withdrawal symptoms in the addicted patient
- **Side Effects**: Precipitous vomiting, Dysrhythmias, acute withdrawal
- **Dosage, route**:
  - **Adult**: 0.5 mg IV, IM, or SC to a max of 1.5 mg or 1.5 mg/70kg. May give additional 0.5-1.0 mg in 2--5 minutes
  - **Pediatric**: None

### Bumetanide -- substitute for Furosemide

- **Indications**: Congestive heart failure, pulmonary edema
- **Contraindications**: Pregnancy, hypokalemia, not indicated for use on patients less than 18 years of age
- **Side Effects**: Nausea/vomiting, potassium depletion, dehydration
- **Dosage, route**:
  - **Adult**: 0.5-1.0 mg IV push (slowly over 1-2 minutes). May give IM. (bumetanide can be substituted at approx a 1:40 ratio of bumetanide to Furosemide)
  - **Pediatric**: None

### Verapamil- substitute for Cardizem

- **Indications**: SVT, atrial fibrillation and atrial flutter with rapid ventricular response
- **Contraindications**: Do not use in patients with shock, severe CHF, AV block, sick sinus syndrome or any wide complex tachycardia, including WPW
- **Side Effects**: Extreme bradycardia, asystole, AV block, hypotension, congestive heart failure
- **Dosage, route**:
  - **Adult**: 2.5-5.0 mg IV push over 2--3 minutes. May rebolus in 15-30 minutes with 5-10 mg IV push until a maximum dose of 20 mg is given.
  - **Pediatric**: None

*This hospital has provisionally met the criteria to become a Primary Stroke Center and can accept stroke patients

Candidates for Stroke Alert:

Any patient with acute onset of focal neurological deficit(s) such as facial asymmetry, arm drift, or slurred speech, known to have had an onset within 24 hours (or longer time period as specified by Primary Stroke Center).
Level III Perinatal Facilities

Current as of
11/3/2017

Banner Desert Medical Center
Banner Thunderbird Medical Center
Maricopa Medical Center

HonorHealth Scottsdale Shea
St. Joseph’s Hospital

High risk pregnancies include: prematurity (<32 weeks), any bleeding in third trimester, pre-eclampsia/eclampsia (seizures), no prenatal care, twins or >, premature rupture of membranes, ante-partum hemorrhage (abruptio placenta, placenta previa, and uterine rupture), or other complications of labor (breech position, prolapsed cord, ect.), or recent drug use. These patients need transport to Level III perinatal facility.

All OB patients should be transported to the ED if the L&D department does not have a ground floor direct entrance. The patient should be rapidly assessed in the ED. If the patient needs to go to L&D without further delay, a hospital provider will accompany the patient and EMS crew to L&D, according to hospital policy.
Cardiac Receiving Centers

Current as of 12/23/2016

Abrazo Arizona Heart Hospital – Phoenix
Abrazo Arrowhead Campus – Glendale
Abrazo Central Campus – Phoenix
Abrazo Scottsdale Campus – Phoenix
Abrazo West Campus – Goodyear
Banner Boswell Medical Center – Sun City
Banner Del E Webb Medical Center – Sun City West
Banner Desert Medical Center – Mesa
Banner Estrella Medical Center – Phoenix
Banner Heart Hospital – Mesa
Banner Thunderbird Medical Center – Glendale
Banner - University Medical Center Phoenix – Phoenix
Banner - University Medical Center Tucson – Tucson
Banner - University Medical Center South – Tucson
Carondelet St. Joseph’s Hospital – Tucson
Carondelet St. Mary’s Hospital – Tucson
Chandler Regional Medical Center – Chandler
Flagstaff Medical Center – Flagstaff
Havasu Regional Medical Center – Lake Havasu City
HonorHealth Deer Valley Medical Center – Phoenix
HonorHealth John C. Lincoln Medical Center – Phoenix
HonorHealth Scottsdale Osborn Medical Center – Scottsdale
HonorHealth Scottsdale Shea Medical Center – Scottsdale
Kingman Regional Medical Center – Kingman
Maricopa Medical Center – Phoenix
Mayo Clinic Hospital – Phoenix
Mercy Gilbert Medical Center – Gilbert
Mountain Vista Medical Center – Mesa
Northwest Medical Center – Tucson
Oro Valley Hospital – Oro Valley
Phoenix Children’s Hospital – Phoenix
Sierra Vista Regional Health Center – Sierra Vista
St. Joseph’s Hospital – Phoenix
St. Luke’s Medical Center – Phoenix
Tucson Medical Center – Tucson
Verde Valley Medical Center – Cottonwood
Western Arizona Regional Medical Center – Bullhead City
Yavapai Regional Medical Center, West Campus – Prescott
Yuma Regional Medical Center – Yuma
**STEPS FOR 12 LEAD ECG INTERPRETATION**

A Step by Step Analysis of 12 lead ECG's

**Rule #1** – NEVER RELY ON THE INTERPRETATIVE STATEMENT PRINTED ON THE 12 LEAD ECG !!!

**Step #1 = Check Rate and Rhythm**
Treat life threatening arrhythmias.

**Step #2 = Evaluate ECG Measurements & Heart Rate**
- QRS Duration = < .12sec or < 120ms
- PR Interval Duration = < .20sec or < 200ms
- Is the heart rate slow, normal or fast?

**Step #3 = Evaluate Leads II and V1**
- What is the ECG rhythm?
- Calculate the rate, does it match the computer's calculation?

**Step #4 = Group the ECG Leads Into Where They Are “Looking”**
- II, III, AVF – Inferior
- I, AVL, V5, V6 – Lateral
- V1, V2 – Septal
- V3, V4 – Anterior

Ask Yourself:
- Are there Q-waves? Pathologic or Physiologic?
- Is the S-T segment depressed, elevated or normal when compared to the T-P segment?
- Are the T-waves inverted?

**Step #5 = Ask a Few Additional Questions???**
- Is there a presence of indicative changes?
- Can it be localized to a specific area?
- What coronary artery is involved?

**Step #6 = Miscellaneous Conditions**
- LBBB
- Ventricular Rhythms
- Left Ventricular Hypertrophy (LVH)
- Pericarditis
- Early Repolarization

**Step #7 = Clinical Presentation**
- Maintain a high index of suspicion, especially in those patients with significant cardiac risk factors (i.e. diabetes, HTN, obese, hereditary, elderly) Be a good detective:
- Remember Anginal Equivalents and Atypical Presentations

**Step #8 = If There Is Acute Infarction**
- Notify the receiving ER or Cardiac Catheterization Lab early on!
- Anticipate possible complications.
- Develop a customized treatment plan.
- Be deliberate, fast and professional.
- Remember Time is Muscle !!!

</tbody>
</table>

(LAD) Left anterior descending artery  
(RCA) Right Coronary Artery  
(Cx) Circumflex artery  
*There may be an overlap in blood supply by the RCA and Cx artery depending on which artery is dominant.

**Ischemia Pattern**: Inverted T-waves or S-T segment depression >1mm (one small box) in two automatically contiguous leads

**Ischemia**: a decreased supply of oxygenated blood to tissue

**Injury Pattern**: S-T segment elevation >1mm (one small box) in two anatomically contiguous leads

**Injury**: damage to tissue, may be irreversible

**Infarct Pattern**: Wide pathologic Q-waves wider than .04 sec or 40 ms (one small box) in two anatomically contiguous leads

**Infarct**: Death to tissue, usually due to lack of oxygenate bloodflow
LEADS VR4 in a Right-sided ECG
RIGHT VENTRICULAR INFARCTION

Accompanies inferior MI 40% of time. If patients presents with changes in Leads II, III, and/or aVF, V3R and V4R (Right-sided chest lead) should be checked. Or run a full right-sided 12 lead (though V3R—V4R is adequate in most studies).

RV infarct (RVI) is an important cause of hypotension in inferior MI and is recognized by JVD with clear lung fields. Use extreme caution with nitrates and morphine in RVI, as both reduce right heart filling (preload) and thus compromise diastole (coronary perfusion pressure).

Appearance therapy is indicated—reperfusion strategies. IV fluids for right heart filling pressure and pacing to maintain rate. Overall mortality is high in RVI accompanying inferior Wall MI, mostly related to a lack of recognition of RV involvement: failure to run V4R chest leads.
V1 = Right side of sternum, 4th intercostal space
V2 = Left side of sternum, 4th intercostal space
V3 = Midway between V2 and V4
V4 = Left midclavicular line, 5th intercostal space
V5 = Left anterior axillary line, same level as V4
V6 = Left midaxillary line, same level as V4
V4R = Right midclavicular line, 5th intercostal space

Skin Preparation To Reduce Artifact
• Use newly opened electrodes, check expiration dates
• Shave application area with razor (if needed)
• Rub application area with a dry 4x4 gauze pad
